

PREACT® 9 SECURE™ TECHNICAL MANUAL

SEPTEMBER 2026

Commitment to Fair Testing

ACT endorses and is committed to complying with the *Standards for Educational and Psychological Testing* (American Educational Research Association [AERA], American Psychological Association [APA], & National Council on Measurement in Education [NCME], 2014). ACT also endorses the *Code of Fair Testing Practices in Education* (Joint Committee on Testing Practices, 2004), which discusses the obligations of those who develop, administer, or use educational tests and test data, particularly in the following four areas: developing and selecting appropriate tests, administering and scoring tests, reporting and interpreting test results, and communicating with test takers. ACT also endorses and is committed to complying with the *Code of Professional Responsibilities in Educational Measurement* (NCME Ad Hoc Committee on the Development of a Code of Ethics, 2023), which specifies the professional responsibilities of those involved with various aspects of tests, including their development, marketing, interpretation, and use.

Preface

The *PreACT® 9 Secure™ Technical Manual* contains technical information about the PreACT 9 Secure test. The principal purpose of the manual is to document technical characteristics of the PreACT 9 Secure test in light of its intended purposes. The *PreACT 9 Secure Technical Manual* documents the collection of validity evidence that supports appropriate interpretations of test scores and describes various content and psychometric aspects of PreACT 9 Secure. Multiple test design and development processes are articulated documenting how ACT builds the assessment in line with the validity argument and how concepts such as construct validity, fairness, and accessibility are attended to throughout the process. Also described are routine analyses designed to support ongoing and continuous improvement and research intended to assure that the program remains psychometrically sound.

We encourage individuals who want more detailed information on a topic discussed in this bulletin, or on a related topic, to contact ACT. Please direct comments or inquiries to [The ACT Test: Contact Us](#).

Chapter 1: PreACT 9 Secure

ACT's Mission

ACT has been dedicated to improving college and career readiness for all students since its inception in 1959. ACT's renowned longitudinal system of assessments, with the ACT® test as a capstone, has provided students, educators, and policymakers with unparalleled measures of college and career readiness. ACT's mission is helping people achieve education and workplace success.

1.1 Philosophical Basis for ACT Tests

PreACT® 9 Secure™ shares a philosophical basis with the ACT, as well as with other PreACT assessments (PreACT® Secure™, PreACT® 8/9, and PreACT®). The assessments all measure student development in English, math, reading, and science. One principal difference between PreACT 9 Secure and the ACT is length: PreACT 9 Secure has fewer items than the ACT. PreACT 9 Secure, targeted for 9th grade, also has a greater emphasis on knowledge and skills typically attained early in students' secondary school experience (up to and including Grade 9). The ACT, for 11th and 12th grades, focuses on knowledge and skills attained as the cumulative effect of the school experience.

Because the content of PreACT 9 Secure is linked to the ACT Holistic Framework®, understanding the philosophical basis for PreACT 9 Secure requires an appreciation of the philosophical basis for the ACT.

The ACT measures how prepared students are for first-year college courses in core subjects. The principal philosophical basis for the ACT is that college preparedness is best assessed by measuring, as directly as possible, the academic skills that students will need in order to perform college-level work. Thus, the ACT is designed to determine how skilled students are at solving problems, grasping implied meanings, drawing inferences, evaluating ideas, and making judgments in subject-matter areas important to success in college.

Also, the ACT is oriented toward the general content areas of college and high school instructional programs. The test questions require students to integrate the knowledge and skills they possess in major curriculum areas with the stimulus material provided by the test. Briefly, then, the philosophical basis for the ACT rests on two pillars: (a) The tests should measure academic skills necessary for education and work after high school, and (b) the content of the tests should assess common state standards and objectives in core academics in ELA, math, and science.

1.2 Overview of PreACT 9 Secure

PreACT 9 Secure is very similar to the PreACT 8/9 and PreACT assessments. The primary difference is that PreACT 9 Secure offers greater security through shorter testing windows and secure control of test content. We expect PreACT 9 Secure scores to support the same

interpretations that have been established for PreACT 8/9 and PreACT scores. However, PreACT 9 Secure may offer advantages over PreACT 8/9 and PreACT for uses and interpretations involving higher-stakes decisions. In this technical manual, much of the information provided for PreACT 9 Secure is similar to what is provided for the other PreACT assessments. Some of the reporting features supporting the interpretations of PreACT 9 Secure test scores, including the readiness benchmarks and predictions, are based on studies of other PreACT assessments. As more data are collected for PreACT 9 Secure, we will evaluate whether different score interpretations are needed for PreACT 9 Secure and the other PreACT assessments.

PreACT 9 Secure predicts performance on the ACT test for English, math, reading, and science; it is targeted for 9th grade but can be administered to students at any grade level.

Like all ACT assessment programs, PreACT 9 Secure is based on the belief that students—and their parents or guardians, teachers, counselors, and school administrators—will make more productive plans and decisions if they have organized, relevant information available when they need it most.

PreACT 9 Secure is vertically aligned to measure educational progress in the context of preparing for the ACT and planning for college and careers. PreACT 9 Secure includes four multiple-choice test sections—English, math, reading, and science. The results from PreACT 9 Secure can be used to help students plan their coursework and other learning opportunities to help ensure that they are prepared for the ACT and their postsecondary goals. High schools can use PreACT 9 Secure data for school or course placement, academic advising, counseling, and program evaluation. The secure nature of the assessment also lends itself to evaluating student readiness for advanced high school courses and college courses (e.g., postsecondary educational opportunity, dual enrollment), identifying students likely to succeed in talented and gifted programs, and determining student eligibility for scholarships. PreACT 9 Secure may also be used for local, state, or federal accountability.

ACT provides customers with administration materials, including interpretive guides for score reports. The PreACT 9 Secure individual student report, which is available for each examinee, contains sections about the student's scores; predicted PreACT, ACT, and ACT® WorkKeys® National Career Readiness Certificate™ (NCRC®) scores; and [Ideas for Progress](#). The interpretive guide called [Using Your PreACT 9 Secure Results](#), along with the PreACT 9 Secure individual student report, can help students get a better sense of where they are, where they might want to go, and how to get there.

PreACT 9 Secure functions as a stand-alone assessment and as a precursor to PreACT or PreACT Secure and the ACT. When used together, these assessments give high school educators a powerful interrelated sequence of instruments for measuring student development. PreACT 8/9 can also be used with PreACT 9 Secure and the ACT, providing an earlier measure of development toward college and career readiness.

PreACT 9 Secure, PreACT Secure, and ACT test scores are reported on the same scale; the range of PreACT 9 Secure scale scores is 1 to 32, while the range of PreACT Secure is 1 to 35 and the range of the ACT is 1 to 36.

PreACT 9 Secure also provides standards-based interpretations through the ACT[®] College and Career Readiness Standards—statements that describe the knowledge and skills students have demonstrated through their performance on the test. Because the Standards focus on the integrated higher-order thinking skills that students develop in Grades K–12 and that are important for success both during and after high school, the Standards provide a common language for secondary and postsecondary educators.

Using the Standards, secondary educators can determine the skills students are likely to have and those they are ready to learn next. The Standards clarify college expectations in terms that high school teachers understand. The Standards also offer teachers guidance for improving instruction to help correct student deficiencies in specific areas.

PreACT 9 Secure results, like those from the other PreACT assessments and the ACT, can be used to identify students who are college ready or on target for college readiness. The ACT College Readiness Benchmarks for English, math, reading, science, and STEM were developed to help identify examinees who would likely be ready for college-level work in these subject areas. The PreACT Readiness Benchmarks are the scores indicating that students are on target to meet or exceed the ACT College Readiness Benchmarks. Chapter 5 provides details about the College and Career Readiness Standards and the College Readiness Benchmarks.

PreACT 8/9, PreACT, PreACT 9 Secure, PreACT Secure, and ACT results give schools a way to get students engaged in planning their futures. Table 1.1 summarizes the assessments' components.

Table 1.1. Components of ACT College and Career Readiness Assessments

Component		Assessment

1.2.1 PreACT 9 Secure Individual Student Reports

The PreACT 9 Secure individual student report facilitates interpretation of PreACT 9 Secure scores with respect to college readiness, predicted performance on the PreACT and ACT tests, and national norms. Reporting category scores are presented for each test section (English, math, reading, and science), showing how students performed on different topics within each subject. Ideas for progress based on the ACT College and Career Readiness Standards are organized by reporting category.

Each reporting category is based on a subset of items in the test section. For each reporting category, the student report shows the following:

- total points possible
- total points achieved
- percentage correct

Additionally, PreACT 9 Secure reports a Progress Toward the ACT WorkKeys National Career Readiness Certificate indicator. This indicator represents a prediction of the level students are likely to earn on the ACT NCRC if they take ACT® WorkKeys® in 12th grade.

The report is accompanied by a booklet, [Using Your PreACT 9 Secure Results](#), which provides interpretive information about the test results, describes ACT services and policies, and tells examinees how to contact ACT for further information.

1.3 Purposes, Claims, Interpretations, and Uses of PreACT 9 Secure

In creating PreACT 9 Secure, ACT wrote a theory of action (TOA) that integrates content validity (academic research, curriculum information, and standards) with predictive validity (empirical data), thus following methodologies similar to those used to build the ACT. The TOA begins by answering fundamental questions about the purpose of the assessment, such as “Who are the intended users? What are the intended uses of the assessment results? What claims should be supported by the assessment? What are the intended benefits that may result from using the assessment? What are the measurable outcomes from using the assessment?”

The answers to these questions emerge from rigorous research and data collection that inform and allow for the identification of high-value skill targets in each subject area, providing focal points for the development of tasks and test forms. The TOA’s process further gives rise to possible ways of achieving the intended goals of the assessment. For example, cognitive labs, piloting, and field-testing are used to validate results and iteratively improve the specifications and design of the assessment. Operational results are used to continuously improve the components of the assessment.

1.3.1 Intended Users

High school students are the target population and primary users of the assessment. While PreACT 9 Secure can be taken by students at any grade level, testing in 9th grade optimizes the benefits of testing. Additional users include parents and guardians interested in their child's performance, teachers interested in helping students identify areas of improvement, high school counselors and academic advisors responsible for helping students with postsecondary planning, and school administrators responsible for evaluating educational programs. PreACT 9 Secure users could also include talent identification programs and other organizations promoting college and career programs. State education agencies may also use PreACT 9 Secure as part of their state's accountability system.

1.3.2 Intended Uses

The primary uses of PreACT 9 Secure include

1. monitoring progress toward college and career readiness,
2. predicting performance on the PreACT, ACT, and ACT WorkKeys tests, and
3. identifying academic gaps and areas for improvement.

Use 1 is supported by the ACT College Readiness Benchmarks and the PreACT Readiness Levels. Students who score at or above the ACT College Readiness Benchmarks demonstrate that they are ready for first-year college courses in the related subject areas. Student achievement is expected to grow between PreACT 9 Secure and the ACT test (typically given in 11th and 12th grades). Therefore, students who score below the Benchmarks on PreACT 9 Secure may still be on target to meet them in 11th or 12th grade. Based on their scores, students are placed at one of three PreACT Readiness Levels: On Target, Close to Target, or In Need of Intervention. Use 1 is also supported through the Progress Toward the ACT WorkKeys National Career Readiness Certificate indicator.

PreACT 9 Secure tests are shorter than the corresponding ACT tests and are vertically aligned to predict student performance on the ACT (excluding writing), supporting Use 2. Predicted ACT score ranges are reported for English, math, reading, and the Composite score, as well as science and the STEM score if science was tested. PreACT 9 Secure simulates the ACT testing experience and provides students, parents, and educators with valuable insights while there is still time to gain needed knowledge and skills, which can later be demonstrated on the ACT.

PreACT 9 Secure results can help students and educators identify academic gaps and areas for improvement (Use 3). Within each subject area, reporting category scores let educators see how students performed on each topic aligned to the ACT College and Career Readiness Standards. The PreACT 9 Secure online reporting package includes several summary reports and data tools to support additional data analysis. ACT's Ideas for Progress, found on the individual student report, can identify specific skills and activities as opportunities for improvement in each reporting category based on the section score.

Additional intended uses of PreACT 9 Secure include

4. gauging readiness for advanced high school and college courses,
5. evaluating school and program effectiveness,
6. understanding performance relative to national norms, and
7. satisfying accountability testing and reporting requirements.

Because it is a secure assessment, PreACT 9 Secure may offer advantages over PreACT 8/9 and PreACT for uses and interpretations involving higher-stakes decisions, such as determining readiness for college courses (Use 4) and satisfying accountability assessment requirements (Use 7). PreACT 9 Secure can also be used to determine eligibility for scholarships, school placement, and talent search programs.

1.3.3 Claims

The claims of PreACT 9 Secure are closely related to the intended uses and are supported by other evidence contained in this technical manual. The primary claims include the following:

1. PreACT 9 Secure measures where students fall on an empirically derived college and career readiness trajectory. See Chapter 5 for more details on the ACT College Readiness Benchmarks, PreACT Readiness Benchmarks, and Progress Toward the ACT WorkKeys National Career Readiness Certificate indicator.
2. Because PreACT 8/9 and PreACT scores are strong predictors of ACT English, math, reading, science, STEM, and Composite scores, we anticipate that PreACT 9 Secure scores will be as well. See Chapter 6 for more details on how the predictions are derived and see Chapter 7 for additional evidence of how well PreACT scores predict ACT scores.
3. PreACT 9 Secure provides instructionally actionable information to students, parents, and educators. PreACT 9 Secure data can be used to identify students' strengths and weaknesses in content areas at a variety of levels (student, classroom, school).

The secondary claims of PreACT 9 Secure include the following:

4. PreACT 9 Secure scores can be used to identify students who are ready to succeed in advanced high school courses, including AP and dual enrollment courses. See Chapter 7 for evidence of how well PreACT test scores have predicted success on AP exams.
5. PreACT 9 Secure can be used as one component of the evaluation of school, program, and curriculum effectiveness. When PreACT 9 Secure is used in conjunction with other ACT assessments, growth measures can be used to help evaluate educational

programs. See Chapter 8 for more information on how PreACT 9 Secure scores can be used to measure student growth.

6. PreACT 9 Secure allows users to understand how students at the same grade level and semester performed relative to the ACT-tested U.S. population. See Lu and Allen (2019) for details on the methodology used for PreACT norming studies.
7. PreACT 9 Secure improves test security through shorter testing windows and secure control of test content.

1.3.4 Intended Benefits

- Students are exposed to the types of content featured on the ACT and to the ACT testing experience.
- Students get predicted ACT scores, which help them understand how their performance is related to college and career readiness.
- Students, parents, and educators understand students' relative strengths and weaknesses in the same subject areas that are assessed by the ACT.
- Schools and districts gain important insights about curriculum and program effectiveness.
- Educators gain insights that help them identify students who are ready for advanced high school coursework and college courses.

1.3.5 Intended Outcomes

The measurable outcomes of PreACT 9 Secure include the following:

- improved performance in academic areas identified as relative weaknesses
- higher rates of success in advanced high school courses
- higher PreACT and ACT scores
- higher enrollment and rates of success in college and career-training programs

Research is conducted on an ongoing basis to evaluate the extent to which the use of the PreACT assessments results in these intended outcomes, and future research will include PreACT 9 Secure.

1.4 Code of Fair Testing Practices in Education and Code of Professional Responsibilities in Educational Measurement

Since the publication of the original edition in 1988, ACT has endorsed the *Code of Fair Testing Practices in Education* (Joint Committee on Testing Practices, 2004), a statement of the obligations to test takers of those who develop, administer, or use educational tests and test data. The development of the *Code* was sponsored by a joint committee of the American Association for Counseling and Development, the Association for Measurement and Evaluation in Counseling and Development, the American Educational Research Association, the American Psychological Association, the American Speech-Language-Hearing Association, and the National Council on Measurement in Education to advance, in the public interest, the quality of testing practices.

The *Code* sets forth fairness criteria in four areas: developing and selecting appropriate tests, administering and scoring tests, reporting and interpreting test results, and communicating with test takers. Separate standards are provided for test developers and test users in each of these four areas.

ACT's endorsement of the *Code* represents a commitment to vigorously safeguarding the rights of individuals participating in its testing programs. ACT routinely reviews each of its testing programs to ensure it upholds the standards outlined in the *Code* for appropriate test development practice and test use.

Similarly, ACT endorses and is committed to complying with the *Code of Professional Responsibilities in Educational Measurement* (NCME Ad Hoc Committee on the Development of a Code of Ethics, 1995), a statement of professional responsibilities for those who develop assessments; market and sell assessments; select assessments; administer assessments; interpret, use, and communicate assessment results; educate about assessments; evaluate assessment programs; and conduct research on assessments.

1.5 Test Preparation

Awareness of and exposure to an assessment before taking it is important if students are to feel comfortable and confident when testing. ACT offers a free PreACT 9 Secure practice test that is delivered on the same test engine students will use to take the assessment during the school day. Accompanying materials, including a scoring guide and a Preparing for PreACT 9 Secure website, also offer testing tips for students.

- [Preparing for PreACT 9 Secure website](#)
- [PreACT 9 Secure scoring guide](#)
- [PreACT 9 Secure practice test online](#)

In addition to offering a PreACT 9 Secure practice test, ACT offers other free and affordable test preparation solutions for students, parents, and educators. Although these resources are designed for the ACT, they are also appropriate for students preparing for PreACT 9 Secure.

- **ACT Question of the Day.** We post a daily test question to provide students with an opportunity for quick daily practice. Students and teachers can opt to receive a weekly email reviewing the questions posted that week.
- **Preparing for the ACT Test or Preparación Para el Examen ACT.** This booklet includes a full-length practice test, test-taking strategies, and information on what to expect on test day. This publication is available in [English](#) and [Spanish](#) and is free to download.
- **Online Familiarity Assessment.** A full-length ACT practice test is available in our simulated online testing environment. Students may also access both timed and untimed practice tests for each ACT section test. Students may access each of the section tests as often as they wish in order to become comfortable with testing.
- **Alternate Assessment Format Samples.** Students who will test with alternate formats of the assessment can prepare by practicing with one of our alternate format samples. Full-length ACT practice tests are available in braille, large print, audio, and reader's scripts at no cost to the school.

Chapter 2:

PreACT 9 Secure Test Development

2.1 Overview

This chapter describes ACT's test development process, including item and form development procedures. It includes brief overviews of the content and bias review processes and of the statistical criteria for form assembly and operational item selection. This chapter also provides a high-level description of PreACT 9 Secure scoring procedures, including descriptions of additional scores and indicators.

2.2 Description of PreACT 9 Secure

PreACT 9 Secure provides practice for PreACT and the ACT test and empowers students, their parents, and educators with valuable insights. The experience of taking the PreACT 9 Secure and PreACT Secure tests, combined with rigorous high school coursework, will help students perform their best when they take the ACT.

The ACT, PreACT Secure, and PreACT 9 Secure have a common purpose—supporting students at key decision points in their academic preparation and planning. These tests provide information helpful to educators guiding students through important educational and career decisions.

The ACT, PreACT Secure, and PreACT 9 Secure English, mathematics, reading, and science tests are designed with developmentally articulated test specifications, ensuring that the content follows a logical developmental sequence across the high school experience. They also share common item formats and follow consistent reporting procedures.

Despite having different score ranges, PreACT 9 Secure (with a range of 1–32), PreACT Secure (with a range of 1–35), and the ACT (with a range of 1–36) are on the same vertically linked score scale. This allows comparison of a student's scores on the three assessments. An increase in either the Composite score or any test section score from PreACT 9 Secure and PreACT Secure to the ACT can be interpreted as growth in academic achievement.

Content specifications describing the knowledge and skills to be measured by PreACT 9 Secure were determined through a detailed analysis of common grade-level standards and feedback from current high school and postsecondary teachers via the ACT National Curriculum Survey®, as well as data about student performance on the ACT and in postsecondary courses. These empirical data are used to continually verify that PreACT 9 Secure is grade appropriate, aligns to the ACT and the ACT College and Career Readiness Standards, and measures the knowledge and skills required for students to become ready for postsecondary and career success.

2.3 The ACT National Curriculum Survey

Every few years, ACT conducts the ACT National Curriculum Survey, which assesses educational practices and college and career readiness expectations. ACT surveys thousands of K–12 teachers and college instructors in English, writing, mathematics, reading, and science, as well as a national cross-section of workforce supervisors and employees, to determine which skills and knowledge in these subjects are being taught at each grade level and which skills and knowledge are considered essential for college and career readiness.

The survey also includes questions about which skills from the ACT Holistic Framework are essential to college and career success. The Holistic Framework is a research-based framework that integrates behavioral skills, education and career navigation skills, and dimensions such as core academic skills and cross-cutting capabilities.

ACT uses the results of the ACT National Curriculum Survey to guide the development of ACT assessment solutions, including the ACT test, PreACT assessments, and ACT WorkKeys. ACT conducts the survey to ensure that its assessments measure the knowledge and skills that instructors of credit-bearing first-year college courses identify as important for success in each content area or that workforce supervisors identify as important for job success and readiness for targeted workforce training.

ACT makes the results of each ACT National Curriculum Survey public to help education and workforce stakeholders make more informed decisions about the skills students need to be successful in postsecondary education and the workplace.

2.3.1 *The Purpose of the ACT National Curriculum Survey*

The ACT National Curriculum Survey is a crucial step in the process of building and regularly updating a suite of ACT assessments that is empirically aligned to college readiness standards. Survey results help address a critical question: Does the test measure knowledge and skills currently relevant to college and career success? Ultimately, the survey data inform the blueprints for the assessments. Subsequently, results from the assessments are used to validate the ACT College and Career Readiness Standards and the ACT College Readiness Benchmarks.

Equally important is predictive validity. Does the test accurately and reliably predict performance? Constant monitoring allows ACT to ensure that the answer is yes.

To maintain relevancy and currency, assessments should be constructed using up-to-date evidence of what matters most. ACT therefore uses findings from the ACT National Curriculum Survey to periodically update the test content coverage and blueprints. This process ensures that the assessments always measure not only what is being taught in schools around the country but also what demonstrably matters most for college and career readiness.

The science behind ACT's assessments—the evidence base and ongoing research—is critical to answering the key question of what matters most for college and career readiness. The ACT National Curriculum Survey represents ACT's commitment to

- using evidence and research to develop and validate ACT standards, assessments, and benchmarks;
- maintaining a robust research agenda to report on key educational metrics; and
- developing assessments, reports, and interventions that will help individuals navigate their personal path to success along a kindergarten-through-career continuum.

As an educational research organization, ACT uses these principles to drive the development and continuous improvement of ACT's education and workplace solutions, as well as the research agenda associated with them, thereby enabling ACT to fulfill its mission of helping all individuals achieve education and workplace success.

2.3.2 Survey Sample and Process

For the 2020 ACT National Curriculum Survey, ACT recruited participants via various print and electronic methods (e.g., advertisements, email, social media) and invited participation from educators at the elementary school, middle school, high school, and college levels who taught courses in English and writing, mathematics, reading (including English language arts and social studies), and science in public and private institutions across the United States. ACT also invited participation from supervisors and employees at a large variety of businesses. Table 2.1 gives the numbers of survey respondents in each area.

Table 2.1. ACT National Curriculum Survey 2020 Respondents

Area	Number of respondents
Early elementary school	1,214
Late elementary school	1,213
Middle school	1,623
High school	1,619
K–12 administrators	405
College instructors	2,883
Workforce supervisors	405
Workforce employees	406
Total	9,768

Education participants were asked to rate discrete content knowledge and skills with respect to how important each was to student success in the content area. Specifically, K–12 teachers were asked to rate the importance of content knowledge and skills in a given class they taught, while college instructors were asked to rate the importance of content knowledge and skills as prerequisites to success in a given class they taught.

ACT also asked the K–12 teachers to indicate whether they taught particular content knowledge or skills and, if so, whether they taught this material as a standard part of their course or as part

of a review of material that should have been learned earlier. Some education participants were also asked other content-related questions, depending on the grade level they taught.

Workforce participants were asked to rate discrete skills with respect to how important each was to entry-level success in the workplace. ACT also asked workforce participants to indicate how often employees in their workplace used each of these skills on the job.

Finally, ACT asked all participants questions relevant to current education policy issues (e.g., assessments, technology, standards, student characteristics, and obstacles to success). These results are discussed in the companion report [ACT National Curriculum Survey 2020](#).

Because some content areas were surveyed in larger numbers than others, the values displayed in educational-level totals were averaged across English language arts, mathematics, and science. This ensured that, in these results, no one content area would have more influence than another.

2.4 Test Development Procedures

2.4.1 Review of Test Specifications

Two major types of test specifications are used in developing PreACT 9 Secure tests: content specifications and statistical specifications.

Content Specifications

The content specifications for PreACT 9 Secure were informed by the curricular analysis discussed previously. While ACT takes care to ensure that the basic structure of PreACT 9 Secure tests remains the same from year to year so that the scale scores are comparable, the specific characteristics of the test items used in each reporting category are reviewed regularly. Subject matter experts review the new test forms to verify both their content accuracy and the match between the test content and the content specifications.

Statistical Specifications

Statistical test specifications establish target test difficulty by defining both the desired mean difficulty and the expected distribution of difficulty as measured by proportion-correct statistics and/or mean IRT b -parameter values. The specifications also specify minimum acceptable levels of item discrimination using biserial correlation coefficients and/or minimum IRT a -parameter values. In addition, differential item functioning (DIF) is carefully evaluated to identify items that may perform differently across examinee groups after ability is controlled for. Items must satisfy the applicable difficulty, discrimination, and DIF review criteria to be eligible for inclusion in the test.

Items on PreACT 9 Secure tests have a wide distribution of item difficulties so that the tests will effectively differentiate among students who vary widely in their level of achievement, allowing students of all abilities to demonstrate what they know and can do.

2.4.2 Selection of Item Writers

ACT relies primarily on internal content specialists to develop items. Content specialists are subject matter experts, trained in the disciplines for which they write items. Most have experience teaching at various levels, from high school to university, and at a variety of institutions, from small private schools to large public institutions. ACT makes every attempt to include item writers who represent the diversity of the population of the United States with respect to ethnic background, gender, and geographic location.

Each content specialist is familiar with an item writer's guide that is specific to their content area. These guides include example items, test specifications, and ACT's requirements for content and style. They also provide specifications for the fair portrayal of all groups of individuals, including use of gender-neutral language, balanced representation of race and ethnicity, and avoidance of subject matter that may be unfamiliar to members of certain groups. Item development assignments are balanced among content specialists to ensure a diversity of material.

Depending on development needs, ACT may contract with external item writers or use automated item generation. Each contracted item writer produces a small number of items in the content area for which they qualify. The small size of the assignment ensures that a diversity of material is produced and that the security of the testing program is maintained, since any item writer will know only a small proportion of the items produced. Item writers work closely with ACT content specialists, who help them produce high-quality items that meet the test specifications. Automated item generation uses models with interchangeable elements based on items that were administered in the past and exhibited desirable statistical properties (e.g., difficulty and discrimination).

2.4.3 Item Development

Item-writing assignments are driven by the test blueprint and item pool analyses with the goal of attaining a wide range of high-quality items that elicit evidence of the knowledge, skills, and abilities measured in each test. A typical assignment includes the evidence-based item template and focuses on a statement describing a skill the item needs to assess. Included in each template is a set of statements describing the evidence each item must elicit.

Assignments are made available to qualified item writers through the ACT item authoring system. This system also contains item metadata, comments from reviewers, and item quality metrics.

All items must be psychometrically sound and meet the test blueprint. Many items must be constructed because many items, even those written by experienced item writers, fail to meet ACT's standards.

Each item writer submits a set of items, called a unit, in a given content area. All items on the English and reading tests are related to prose passages. All items on the science test are

related to passages or other stimulus material, such as graphs and tables. All items on the math test are discrete—that is, not related to a passage.

2.4.4 Review of Items

Each submitted item (and its related passage, if applicable) is reviewed several times by ACT staff to verify that it meets all of ACT's standards. It is edited to meet ACT's specifications for content accuracy, word count, item classification, item format, and language. During the review and editing process, all test materials are reviewed for fair portrayal and balanced representation of social groups and for gender-neutral language.

After internal item reviews are completed, ACT invites external reviewers with knowledge and experience in those content areas, including practicing teachers at a variety of grade levels, to refine items and verify whether the items sample intended constructs. Every item is independently reviewed by four to six subject matter experts from across the United States, each of whom has extensive experience with students at or around the grade levels at which the test content is typically taught. During the external content review, items are evaluated for content accuracy, item format, and the effectiveness of language in terms of leveling, precision, and fairness.

Bias, Sensitivity, Fairness, and Accessibility Reviews

To verify that all items delivered to students are fair, unbiased, and accessible, ACT conducts external fairness and accessibility reviews for all items before field-testing and for entire test forms before they become operational. In this context, “accessible” means that examinees can access the construct measured by the assessment and accurately demonstrate their construct-relevant knowledge and skills when responding to test items. Avoiding content that is potentially biased is one important aspect of accessibility. Chapter 4 describes ACT's approach to another aspect: designing tests and providing testing accommodations for English learners and students with disabilities.

The external fairness and accessibility review panel consists of experts in diverse educational areas who have experience working with diverse populations at the appropriate grade levels and in the relevant content areas. The panel reviews items to help verify they are fair, free of bias or insensitivity, and accessible to the testing population. All comments are reviewed, and appropriate changes are made. Because stakeholders count on national representation to maintain the comparability of test forms and scores, ACT selects reviewers in such a way that no one state is overrepresented.

2.4.5 Embedded Field-Tests

Sets of items judged acceptable following the review process are embedded in test forms and field-tested with representative samples of students. Each test section in a test form contains a set of embedded field-test (EFT) items. Different sets of EFT items are spiraled into each test form.

EFT items do not contribute to a student's total reported test section score but are designed to be indistinguishable from scored items. By juxtaposing EFT items with scored items, it is expected that students will invest the same level of effort when answering both types of items. The time limit for each test section permits most students to answer all scored and EFT items.

EFT Item Analysis

EFT items are analyzed using classical test theory (CTT) and item response theory (IRT).

When CTT is used for a given set of EFT items, the sample is divided into low-, medium-, and high-performing groups based on the individuals' scores in the same test section. The cutoff scores for the three groups are the 27th and 73rd percentiles in the distribution of those scores. These percentiles maximize the critical ratio of the difference between the mean scores of the upper and lower groups, assuming that the standard error of measurement in each group is the same and that the scores for the entire examinee population are normally distributed (Millman & Greene, 1989). For each group, the proportion of students who correctly answered each EFT item is computed, as well as the proportion of students who chose each of the incorrect answers. The biserial and point-biserial correlation coefficients of each EFT item are also computed.

When IRT is used, EFT items are calibrated using the 3-parameter logistic (3PL) IRT model (Birnbaum, 1968). Three parameters are estimated for each item: the discrimination parameter, the difficulty parameter, and the pseudo-chance parameter. The estimated parameters are then transformed to the same scale as all previously calibrated items using the Stocking–Lord method (Stocking & Lord, 1983).

Item analyses identify statistically effective test items. Items are eliminated or revised for future field-testing if they are too difficult or too easy or if they fail to discriminate between students of high and low educational achievement as measured by their corresponding test scores. The biserial and point-biserial correlation coefficients, as well as the differences between proportions of students answering the item correctly in each of the three groups, are used as indices of the discriminating power of the EFT items when CTT is used.

Differential item functioning (DIF) analysis procedures are also conducted on the EFT items. DIF is a statistically significant difference between the probability of a specific population group (the focal group) answering the item correctly and the probability of a comparison population group (the reference group) answering correctly when the students in the two groups have similar levels of achievement with respect to the content being tested. Items exhibiting large and statistically significant DIF are reviewed by a diverse panel of external fairness reviewers.

Each EFT item is reviewed following the item analysis. To identify possible problems, ACT staff members scrutinize items flagged for statistical reasons. In some cases, items are revised and undergo further review. The review process also provides feedback that helps improve the quality of items in the future.

2.4.6 Assembly of Test Forms

EFT items that are judged acceptable following the item analysis and subsequent review are placed in an item pool. Preliminary versions of PreACT 9 Secure test forms are constructed using items from this pool that match the content and statistical specifications for the test.

2.4.7 Content, Fairness, and Accessibility Reviews of Test Forms

The preliminary versions of the test forms are subjected to several reviews to ensure that the items are accurate and that the overall test forms are fair and conform to good test-construction practice. The first review is performed by ACT staff. Items are checked for content accuracy and conformity to ACT style. They are also examined for clues that could allow test-wise students to answer the item correctly even though they lack the required skills or subject-area knowledge.

The preliminary versions of the test forms are then submitted to content, fairness, and accessibility experts for external review. These experts are different from those consulted for the content, fairness, and accessibility reviews of the EFT items but are drawn from the same populations of curriculum and education specialists and perform the same types of reviews described in Section 2.4.4.

Two panels—a content review panel and a fairness and accessibility review panel—review the test forms. The content review panel consists of high school teachers, curriculum specialists, and college and university faculty members. This panel reviews the forms for content accuracy, educational importance, and grade-level appropriateness. The fairness and accessibility review panel consists of experts in diverse areas of education, with a balanced representation of genders and experience working with diverse populations. This panel reviews the forms to help ensure fairness to all examinees.

After the panels complete their reviews, ACT summarizes the results. All comments from the consultants are reviewed by ACT staff members, and appropriate changes are made to the test forms. Whenever significant changes are made, such as items or passages being replaced, the test forms are reviewed again by the appropriate consultants and by ACT staff. If no further changes are needed, the test forms are published.

2.5 PreACT 9 Secure Scoring Procedures

The raw score for each PreACT 9 Secure test is equivalent to the number of scored questions answered correctly. It is converted to a scale score, which is discussed further in Chapter 6.

The Composite score is the average of the English, mathematics, and reading scale scores. The Composite score is rounded to the nearest whole number and has a minimum value of 1 and a maximum of 32. The student also receives section scores and a STEM (science, technology, engineering, and math) score if both mathematics and science were taken.

2.5.1 Additional Scores and Indicators

Beginning with the September 2015 ACT test, ACT began reporting a STEM score, a combination of a student's mathematics and science scores. Also introduced at that time was the Progress Toward the ACT® WorkKeys® National Career Readiness Certificate™ (NCRC®) indicator. These scores are also reported for PreACT 8/9, PreACT, and PreACT Secure.

The STEM Score

The STEM score is the average of the mathematics and science scale scores rounded to the nearest integer (0.5 rounds up). Only students who receive scores for both tests receive a STEM score.

Progress Toward the ACT WorkKeys National Career Readiness Certificate (NCRC) Indicator

The Progress Toward the ACT WorkKeys NCRC indicator is based on students' PreACT Secure Composite scores. It provides an estimate of students' likely performance on the ACT WorkKeys National Career Readiness Certificate (NCRC). The ACT NCRC is an assessment-based credential that certifies foundational work skills important for job success across industries and occupations. The ACT NCRC is based on the results of three ACT WorkKeys assessments: Applied Math, Graphic Literacy, and Workplace Documents. Scores on these assessments determine the certificate level an individual can earn—no certificate, Bronze, Silver, Gold, or Platinum. The ACT NCRC gives individuals evidence that they possess the skills employers deem essential to workplace success. More information about the ACT NCRC can be found on [ACT's website](#). More details on ACT test scores and indicators can be found in Chapter 7.

2.6 PreACT 9 Secure Score Scales

Scale scores are reported for PreACT 9 Secure English, mathematics, and reading tests. If the student completed the optional science test, the science scale score is also reported. Scale scores are also reported for the Composite score and the STEM score (calculated by rounding the unweighted average of the mathematics and science scale scores, if both tests were taken; rounding is to the nearest integer, and 0.5 rounds up). PreACT 9 Secure, PreACT Secure, and ACT scale scores can be compared because they are vertically linked (see Chapter 6 for more details).

PreACT 9 Secure score scales have a maximum of 32. The rationale for setting the maximum scale score on PreACT 9 Secure tests at 32, rather than at 36 as it is for the ACT tests or at 35 as it is for the PreACT Secure, is that PreACT 9 Secure is intended to be a shorter and less difficult version of the ACT or PreACT Secure. Because it is easier to obtain a perfect score on PreACT 9 Secure than it is on the ACT or PreACT Secure, ACT decided to cap PreACT 9 Secure scores at a lower value.

Chapter 3:

PreACT 9 Secure Test Specifications

3.1 Overview

This chapter describes the content blueprints for each of the four multiple-choice PreACT 9 Secure tests.

3.2 English Test

3.2.1 Description of the English Test

The PreACT 9 Secure English test has 44 items (33 scored items and 11 field-test items) and a 35-minute time limit. The test places the student in the position of a writer who is revising and editing a text and measures a student’s understanding of the following: the conventions of standard written English (grammar, usage, and mechanics), the production of writing (topic development, organization, unity, and cohesion), and knowledge of language (word choice, style, and tone). The test consists of several passages, each accompanied by a sequence of multiple-choice items. Different passage types—informational, narrative, and argumentative—are employed to provide a variety of rhetorical situations. Students must use the rich context of the passage to make editorial choices, demonstrating their understanding of writing strategies and conventions. Passage length also varies, with shorter passages featuring 5–6 items and longer passages featuring 10–12 items. Passages are written not only to appropriately assess writing and language skills but also to reflect students’ interests and experiences. Spelling and the rote recall of the rules of grammar are not tested.

Cognitive Complexity and Depth of Knowledge (DOK)

Depth of Knowledge (DOK; Webb, 2002) is a rough-grained, judgment-based measure of a test item’s cognitive complexity that is used in many educational contexts. The PreACT 9 Secure English test assesses skills across a range of cognitive complexities using items at DOK Levels 1, 2, and 3. All English items are classified by ACT content experts according to the level descriptions in Table 3.1.

Table 3.1. DOK Level Descriptions for English

Depth of Knowledge level	Description
DOK1	Requires the recall of information, such as a fact, term, definition, or simple procedure.
DOK2	Requires mental processing that goes beyond recalling or reproducing an answer. Students must make some decisions about how to approach a problem.
DOK3	Requires planning, thinking, explaining, justifying, using evidence, conjecturing, and postulating.

3.2.2 English Scores and Reporting Categories

Four scores are reported: a total test score based on the 33 scored items, plus three reporting category scores based on specific knowledge and skills. The three reporting categories are Production of Writing, Knowledge of Language, and Conventions of Standard English. A brief description of the reporting categories is given below, followed by a table showing the approximate percentage of total test items in each reporting category.

Production of Writing

Students apply their understanding of the rhetorical purpose and focus of a piece of writing to develop a topic effectively. They use various strategies to achieve logical organization, topical unity, and cohesion.

Knowledge of Language

Students demonstrate effective language use by ensuring precision and concision in word choice and maintaining consistency in style and tone.

Conventions of Standard English

Students apply their understanding of the conventions of Standard English grammar, usage, and mechanics to revise and edit text.

3.2.3 English Test Blueprints

Table 3.2 shows the current target distribution of scored items across reporting categories on each PreACT 9 Secure English test form.

Table 3.2. Specification Ranges by Reporting Category for English (Scored Items Only)

Reporting category	Number of items	Percentage of test
Production of Writing	11–13	33%–39%
Knowledge of Language	4–6	12%–18%
Conventions of Standard English	14–16	42%–48%
Total	33	100%

3.3 Math Test

3.3.1 Description of the Math Test

The PreACT 9 Secure math test has 34 items (30 scored items and 4 field-test items) and a 45-minute time limit. The test considers the whole of a student's mathematical development, covering topics typically taught up through the beginning of Grade 10 in U.S. schools and focusing on the prerequisite knowledge and skills that are important for success in college math courses and career training programs.

The math construct requires making sense of problems and context, representing relationships mathematically, accessing appropriate mathematical knowledge from memory, incorporating

given information, modeling, performing mathematical computations and manipulations, interpreting, applying reasoning skills, justifying, making decisions based on the math, and appropriately managing the solution process. The test emphasizes quantitative reasoning and application over extensive computation or the memorization of complex formulas. Items focus on what students can do with the math they have learned, which encompasses not only mathematical content but also mathematical practices.

Some degree of computational fluency is required. A calculator is encouraged but not required. Items are designed so that a sophisticated calculator does not provide a significant advantage over a four-function calculator and so that all items can be done without a calculator in a reasonable amount of time.

Each item has four response options, and students are instructed to choose the correct option. The test contains problems ranging from easy to very challenging so that readiness levels can be reliably reported for students with different degrees of preparedness. Extended accessibility supports provide for fair and comparable math scores across a range of circumstances. More information on accessibility can be found in Chapter 4.

Cognitive Complexity and Depth of Knowledge (DOK)

The PreACT 9 Secure math test assesses skills that vary in cognitive complexity using items at DOK Levels 1, 2, and 3. ACT content experts consider how most well-prepared Grade 9 students will approach each item, and they then classify each item according to the level descriptions in Table 3.3.

Table 3.3. DOK Level Descriptions for Math

Depth of Knowledge level	Description
DOK1	Requires the recall of information, such as a fact, term, definition, or simple procedure. Requires students to demonstrate a rote response or perform a simple procedure.
DOK2	Requires mental processing that goes beyond recalling or reproducing an answer. Students must make some decisions about how to approach a problem.
DOK3	Requires planning, thinking, explaining, justifying, using evidence, conjecturing, and postulating. The cognitive demands are complex and abstract.

3.3.2 Math Scores and Reporting Categories

Nine scores are reported for the PreACT 9 Secure math test: a total test score based on the 30 scored items, plus eight reporting category scores based on different domains of mathematical knowledge, skills, and practices. The test is first divided into the Preparing for Higher Math (PHM) and Integrating Essential Skills (IES) reporting categories. The PHM score is then divided into separate scores for Number & Quantity, Algebra, Functions, Geometry, and Statistics & Probability. A crosscutting reporting category, Modeling, draws upon items from all

the other categories to give a measure of producing, interpreting, understanding, evaluating, and improving models. PreACT 9 Secure score reports provide the percentage of correctly answered items in each reporting category.

The total test score is reported on the PreACT 9 Secure math scale, which ranges from 1 to 32. Properties of this scale are given in Chapter 6. The total math score is averaged with the total science score to determine the STEM (science, technology, engineering, and mathematics) score, which is related to success in postsecondary STEM courses.

Preparing for Higher Math

This reporting category captures the math that students have learned more recently. This category is divided into the following five subcategories.

Number & Quantity

Students demonstrate an understanding of and fluency with rational numbers and the four basic operations. They work with irrational numbers, including approximating irrational numbers with rational numbers. They apply properties of the real number system. They use unit analysis to model quantities and solve multistep problems.

Algebra

Students use expressions to solve problems, and they show an understanding of solving equations. They manipulate and evaluate expressions involving integer exponents, square and cube roots, and scientific notation. They solve linear equations and make connections between their graphs and proportional relationships. They use their understanding of linear equations to make sense of other kinds of equations and inequalities: what their graphs look like, how to solve them, and what kinds of applications they have for modeling. They demonstrate extended proficiency with equations by using quadratic, exponential, and simple radical equations as well as systems of equations. They create expressions, equations, and inequalities to represent problems and constraints.

Functions

Students demonstrate an understanding of what a function is and what its characteristics are. They can define functions using two variables or function notation. They use their understanding of the general properties of functions to solve problems using new functions they create. They determine what the characteristics of functions mean in the context of a problem. They work with functions that have no equation and functions that follow the pattern of an equation. They reason with functions by looking at their rates of change, algebraic properties, and connections to graphs and tables. They work with a variety of functions, such as linear, quadratic, exponential, and piecewise, and apply them in modeling situations. They associate changes in the parameters of a function that has a form such as $f(x) + c$ or $a \cdot f(x)$ with transformations of the graph of that function.

Geometry

Students show an understanding of congruence and similarity by using transformations like translations and dilations. They investigate the relationships between the angles formed by parallel lines and a transversal. They model and solve problems with geometric objects. Students find values such as the volumes of spheres, pyramids, and cones. They solve right-triangle problems using the Pythagorean theorem. In the coordinate plane, they recognize conditions for parallel and perpendicular lines, split a line segment into pieces with a given ratio of lengths, and find areas of plane figures.

Statistics & Probability

Students identify patterns of association between two quantities by analyzing scatterplots and two-way tables. They fit linear models to datasets and use the models to solve problems. They use data to estimate a population mean or proportion and make informal inferences based on their judgment of likelihood. They work with sample spaces and calculate the probabilities of events defined in terms of “and,” “or,” and “not.”

Integrating Essential Skills

This reporting category focuses on whether students can combine their knowledge and skills to solve problems of moderate to high complexity. Topics include rate and percentage; proportional reasoning; units of measure; solving problems with rational numbers; constructing and solving simple equations; scale drawings; cross sections; area, perimeter, circumference, surface area, and volume; simple measures of center and spread; probability; and random sampling.

In addition to learning more content as they progress through their studies, students should also grow in sophistication, accumulating and applying skills in higher-order contexts. Therefore, students should be able to solve problems of increasing complexity, combine skills in longer chains of steps, apply skills in more varied contexts, understand more connections, and increase fluency. In order to assess whether students have had appropriate growth, the items in this reporting category are at DOK Levels 2 and 3.

Modeling

Modeling uses math to represent, through a model, an analysis of an empirical situation. Models often help us predict or understand the actual. However, sometimes knowledge of the actual helps us understand the model, such as when addition is introduced to students as a model of combining two groups. The Modeling reporting category represents all items that involve producing, interpreting, understanding, evaluating, and improving models. Each modeling item is also counted in the other appropriate reporting categories. Thus, the Modeling reporting category is an overall measure of how well a student uses modeling skills across mathematical topics.

3.3.3 Calculator Policy

Students are encouraged to bring a calculator they are familiar with and can use fluently. Most four-function, scientific, or graphing calculators are permitted. Built-in computer algebra systems are not allowed because they could interfere with the construct, specifically understanding and implementing the solutions to various types of equations and inequalities. Students must remove certain kinds of programs from their calculators. In addition, some calculator features must be turned off for security reasons or to prevent disruptions during testing. The ACT calculator policy is available on the [ACT website](#).

3.3.4 Math Test Blueprints

Table 3.4 shows the current target distribution of scored items across reporting categories on each PreACT 9 Secure math test form. Test construction also takes into account coverage and variety within each of the categories. The test includes PHM items at DOK Levels 1, 2, and 3. By contrast, it includes IES items only at DOK Levels 2 and 3. This is because IES topics are more practiced and familiar and because putting these familiar skills to work in higher-complexity tasks is important for college readiness.

Table 3.4. Specification Ranges by Reporting Category for Math (Scored Items Only)

Reporting category	Number of items	Percentage of test	
Preparing for Higher Math	—	23	77%
	Number & Quantity	3–4	10%–13%
	Algebra	5–7	17%–23%
	Functions	5–7	17%–23%
	Geometry	3–4	10%–13%
	Statistics & Probability	3–4	10%–13%
Integrating Essential Skills	7	23%	
Modeling	≥6	≥20%	
Total	30	100%	

Note. Each item reported in Modeling is also reported in either Preparing for Higher Math (and the appropriate subcategory) or Integrating Essential Skills.

3.4 Reading Test

3.4.1 Description of the Reading Test

The PreACT 9 Secure reading test has 33 items (25 scored items and 8 field-test items) and a 40-minute time limit. It measures a student's ability to read closely, reason about texts using evidence, and integrate information from multiple sources. The test consists of four passage units, each of which includes a passage or a pair of passages accompanied by 8–9 multiple-choice items. Passages include literary narratives and informational texts from the humanities, natural sciences, and social sciences and are representative of the kinds of texts commonly

encountered in high school courses. Each passage is preceded by a heading that identifies the passage type (e.g., literary narrative) and names the author; it may also contain important background information that helps in understanding the passage.

Reading items focus on the mutually supportive skills that readers apply when studying written materials across a range of subject areas. Specifically, items ask students to determine main ideas; locate and interpret significant details; understand sequences of events; make comparisons; comprehend cause-effect relationships; determine the meaning of context-dependent words, phrases, and statements; draw generalizations; analyze the author's or narrator's voice or method; analyze claims and evidence in arguments; and integrate information from multiple related texts. Items do not test the rote recall of facts from outside the passage or the rules of formal logic, nor do they contain questions about vocabulary that can be answered without referring to the passage context.

Cognitive Complexity and Depth of Knowledge (DOK)

The PreACT 9 Secure reading test assesses skills across a range of cognitive complexities using items at DOK Levels 1, 2, and 3. All multiple-choice items are classified by ACT content experts according to the level descriptions in Table 3.5.

Table 3.5. DOK Level Descriptions for Reading

Depth of Knowledge level	Description
DOK1	Requires the recall of information, such as a fact, term, definition, or simple procedure. Requires students to demonstrate a rote response or perform a simple procedure.
DOK2	Requires mental processing that goes beyond recalling or reproducing an answer. Students must make some decisions about how to approach a problem.
DOK3	Requires planning, thinking, explaining, justifying, using evidence, conjecturing, and postulating. The cognitive demands are complex and abstract.

3.4.2 Reading Scores and Reporting Categories

Four scores are reported: a total test score based on the 25 scored items, plus three reporting category scores based on specific knowledge and skills. The three reporting categories are Key Ideas & Details, Craft & Structure, and Integration of Knowledge & Ideas. A description of each category is given below, followed by a table showing the approximate percentage of the test devoted to each reporting category.

Key Ideas & Details

Students read texts closely to determine central ideas and themes, summarize information and ideas accurately, understand relationships (including sequential, comparative, and cause-effect), and draw logical inferences and conclusions.

Craft & Structure

Students determine word and phrase meanings, analyze how an author uses word choice to achieve a rhetorical effect, analyze text structure, understand authorial purpose and perspective, and analyze points of view. They interpret the rhetorical effects of authorial decisions and differentiate between various perspectives and sources of information.

Integration of Knowledge & Ideas

Students understand authors' claims, evaluate reasoning and evidence, and differentiate between facts and opinions. They use evidence to make connections between different texts that are related by topic.

3.4.3 Reading Test Blueprints

Table 3.6 shows the current target distribution of scored items across reporting categories on each PreACT 9 Secure reading test form.

Table 3.6. Specification Ranges by Reporting Category for Reading (Scored Items Only)

Reporting category	Number of items	Percentage of test
Key Ideas & Details	13–15	52%–60%
Craft & Structure	6–8	24%–32%
Integration of Knowledge & Ideas	3–5	12%–20%
Total	25	100%

3.5 Science Test

3.5.1 Description of the Science Test

The PreACT 9 Secure science test has 32 items (26 scored items and 6 field-test items) and a 35-minute time limit. The test measures the interpretation, analysis, evaluation, reasoning, and problem-solving skills required in the natural sciences. The content of the science test is drawn from the fields of biology, chemistry, physics, and Earth/space science.

Students are assumed to have, or to be in the process of completing, a minimum of 1 year of introductory science, which the ACT National Curriculum Survey has identified as typically 1 year of biology, 1 year of integrated physical science, or 1 year of Earth science. Thus, it is expected that students have learned some introductory content from biology, physical science, and Earth and space science; are familiar with the nature of scientific inquiry; and have been exposed to laboratory investigation.

The test presents several passages containing scientific information, each followed by a number of multiple-choice items. The scientific information is conveyed in one of three formats: data representation (scientific graphs, tables, and diagrams), research summaries (descriptions and results of one or more related experiments), or conflicting viewpoints (two or more brief

theoretical models that address the same scientific phenomenon but are inconsistent with one another).

The Nature of the PreACT 9 Secure Science Test: What Does It Measure?

The PreACT 9 Secure science test assesses science knowledge, skills, and practices across three domains: Interpretation of Data, Scientific Investigation, and Evaluating Scientific Arguments and Models with Evidence.

These three domains, and the knowledge and skills encompassed by each domain, were derived from ACT's decades of empirical data and research on college and career readiness in science. The domains and their skills make up the ACT College and Career Readiness Standards for science, which link specific skills and knowledge to quantitatively determined score ranges for the ACT science test and to the College Readiness Benchmark in science, which predicts success in science at the postsecondary level. These three domains are also the reporting categories for the PreACT 9 Secure science test (see Table 3.8). ACT also reviews science benchmarks and standards from state, national, and international standards documents (e.g., the NRC Framework for K–12 Science Education, the Next Generation Science Standards) and monitors the impact of these documents on science curricula to ensure alignment and, when needed, to update the constructs of the test.

All items on the ACT science test are based on authentic scientific scenarios that are built around important scientific concepts, and they are designed to mirror the experiences of students and working scientists engaging in real science. The ACT science test focuses on multidimensional assessment (to measure three-dimensional learning in science) with items that require students to apply multiple domains. Some of the items require that students have discipline-specific content knowledge (e.g., knowledge specific to an introductory high school physical science or biology course), but all the items focus on science process skills. Research conducted by ACT on science curricula and instruction at the high school and postsecondary levels shows that, while having a fundamental understanding of disciplinary science concepts is important, being able to apply science practices and process skills to science content to solve problems is more strongly tied to college and career readiness in science. The ACT science test focuses on measuring the science skills and knowledge that are empirically tied to college and career readiness.

Cognitive Complexity and Depth of Knowledge (DOK)

The PreACT 9 Secure science test assesses skills at DOK Levels 1, 2, and 3, with most of the items at Levels 2 and 3. Below is an example of how items on the PreACT 9 Secure science test are classified by DOK. All multiple-choice items are classified by ACT content experts according to the level descriptions in Table 3.7.

Table 3.7. DOK Level Descriptions for Science

Depth of Knowledge level	Description
DOK1	Requires locating, recalling, and/or reproducing information.
DOK2	Requires processing presented information and applying skills and concepts. Students typically must process one or two cognitive steps.
DOK3	Requires using higher-order thinking, such as analysis and evaluation, and often requires using evidence to justify reasoning. Students must typically process multiple cognitive steps, and the overall tasks tend to be complex and abstract.

3.5.2 Science Scores and Reporting Categories

Four scores are reported: a total test score based on the 26 scored items, plus three reporting category scores based on different domains of scientific knowledge, skills, and practices. The three reporting categories are Interpretation of Data, Scientific Investigation, and Evaluating Scientific Arguments and Models with Evidence. A description of each reporting category is provided below, and the percentage of the test devoted to each reporting category is provided in Table 3.8. The overall test score is reported on the PreACT 9 Secure science scale, which ranges from 1 to 32. This total science score is averaged with the total math score to determine the STEM score.

Interpretation of Data

Students manipulate and analyze scientific data presented in tables, graphs, and diagrams (e.g., by recognizing trends in data, translating tabular data into graphs, interpolating and extrapolating, and reasoning mathematically).

Scientific Investigation

Students understand experimental tools, procedures, and design (e.g., they identify variables and controls) and compare, extend, and modify experiments (e.g., they predict the results of additional trials). Students also identify goals, constraints, and potential tradeoffs in engineering and design thinking contexts.

Evaluating Scientific Arguments and Models with Evidence

Students judge the validity of scientific information and formulate conclusions and predictions based on that information (e.g., by determining which explanation for a scientific phenomenon is supported by new findings). Students evaluate tradeoffs, success criteria, and constraints in engineering and design thinking contexts.

3.5.3 Science Test Blueprints

Table 3.8 shows the current target distribution of scored items across reporting categories on each PreACT 9 Secure science test form.

Table 3.8. Specification Ranges by Reporting Category for Science (Scored Items Only)

Reporting category	Number of items	Percentage of test
Interpretation of Data	6–13	23%–50%
Scientific Investigation	4–9	15%–35%
Evaluating Scientific Arguments and Models with Evidence	5–10	19%–38%
Total	26	100%

Chapter 4:

Test Administration, Test Security, Accessibility, Accommodations, and Supports

4.1 Administering PreACT 9 Secure

PreACT 9 Secure can be administered during certain limited windows during the testing year. Implementation webinars and resources provide instruction for scheduling testing and ordering materials.

4.1.1 Participation Procedures

In February, the registration portal opens so districts can enroll for the next school year. Districts enroll between February and the following January, and then in January, they receive guidance on importing students, setting up online or paper testing, and assigning accommodations and English learner (EL) supports. Spring testing occurs in March and April. Fall testing occurs between September and October.

4.1.2 Administration Schedule

PreACT 9 Secure is designed to be administered within a half day during school-supervised sessions. It takes about 3 hours 5 minutes to complete the entire program—approximately 30 minutes for the non-test section and 2 hours 35 minutes for the four test sections (if science is taken). The non-test section may be administered in a non-secure supervised school setting on or before the test day. The English, math, and reading sections must be administered in a single session on the designated test day unless a student is approved for multiday testing in their accommodations plan. If testing science, it may be administered with the other subjects or at a later time as outlined in the [Schedule Flexibility Policy](#). Consult the PreACT 9 Secure Administration Manual for information about makeup testing.

4.1.3 PreACT 9 Secure Support Materials

PreACT 9 Secure includes a coordinated set of support materials to help students, parents, guardians, teachers, counselors, and administrators understand the purposes of the program and the information provided.

- Implementation webinars and resources include links to online materials that provide information about PreACT 9 Secure and help schools begin planning their administration.
- The PreACT 9 Secure Administration Manual provides detailed instructions to help test coordinators and testing staff plan and administer the non-test section and the test sections.

- The Accessibility and Supports Guide for PreACT 9 Secure helps educational teams select appropriate accessibility supports and accommodations for their students to use during testing.
- Before testing, the test coordinator will designate each student as testing with standard time, with accommodations, or with EL supports. Paper testing is available only for a limited number of accommodations (braille, large print, and human reader via a reader's script).
- For online testing, all required test materials and tools are included in the TestNav portal. For students testing with accommodations or EL supports, additional tools will be available in the TestNav portal or at the test site.
- For paper testing, schools should order one package of test materials for each student testing with accommodations. Each package includes one standard test booklet, one alternate-format test (braille or tactile graphic booklet, large print, or human reader's scripts for examinees with or without vision), answer documents, and instruction booklets. Each shipment will also include necessary return materials.
- Student and school reports are available in ACT's online reporting system. Students may also create an optional MyACT account to directly access their scores.
- Each student who takes PreACT 9 Secure will have access to Using Your PreACT 9 Secure Results, which includes information about interpreting the student report, planning for high school and beyond, exploring career possibilities, and building academic skills.
- Educators will have access to the PreACT 9 Secure Interpretive Guide for Student and Aggregate Reports, which includes information for helping students understand their student reports and for interpreting the school aggregate reports (Student List Report, Educator Report, and Student Data File).
- The ACT Online Reporting User Guide is available to help testing staff use the online reporting system to retrieve score reports, analyze data, and create school-, district-, and state-level reports.

4.2 Test Security

To ensure the validity of PreACT 9 Secure test score interpretations, the examinees, any individuals who have a role in administering the tests, and those who are otherwise involved in facilitating the testing process must strictly observe ACT's standardized testing policies and procedures, which may be supplemented by ACT from time to time with additional communications to testing staff.

Testing staff must protect the confidentiality of PreACT 9 Secure test items and responses before, during, and after testing. Testing staff should be competent to undertake their roles and

aware of their responsibilities, which include understanding ACT's test administration policies and procedures as well as acknowledging and avoiding conflicts of interest as test administrators for PreACT 9 Secure.

Testing staff must be alert to activities that can compromise the fairness of the test and the validity of score interpretations. Such activities include, but are not limited to, the following:

- prohibited test-taking behaviors, such as copying answers or using prohibited electronic devices during testing
- accessing questions before or after the test; taking photos; capturing or otherwise making copies of test questions or test materials
- posting test questions on the internet
- test proctor or test administrator misconduct, such as providing questions or answers to examinees or permitting them to engage in prohibited conduct during testing

In addition to implementing security-related protocols, ACT may, at its discretion, engage additional test security practices designed to protect PreACT 9 Secure test content and the validity of score interpretations.

4.3 Information Security and Data Privacy

The ACT information security framework is based on the widely recognized National Institute of Standards (NIST) Cybersecurity Framework (CSF). This framework was selected because it covers a range of cybersecurity categories that comprehensively reflect the broad perspective ACT takes in safeguarding information assets. The CSF is a risk-based framework used to improve cybersecurity resilience and reduce risk. It enables ACT to prioritize security initiatives, satisfy compliance requirements, and establish a standard risk management program.

All data stored at ACT are encrypted to meet industry standards for the classification of the information stored. When personal information is transmitted, ACT employs the highest level of encryption possible. This may vary to meet specific customer needs and requirements.

Internal access to systems and data is granted to individual employees based on business need and is restricted to the least privilege required to perform a particular job function. Access is authorized by management and granted by IT security. The ACT Access Management Standard describes the security requirements for password management, account lockouts, screen saver timeouts, and privilege management. Access is revoked immediately upon termination and reviewed when employees transfer to a different position within ACT.

ACT recognizes the importance of protecting learners' personal information. It is important and consistent with ACT's mission to share information with those who can provide educational or career opportunities to learners or who have another legitimate reason to use learner information. However, ACT will not license learner personal information for this purpose without

the learner's express consent and will disclose personal information only as set forth in our Privacy Policy.

At ACT, information security and data privacy are everyone's responsibility. ACT requires all employees to enter confidentiality agreements upon hire. Also, employees are required to annually review ACT's Information Security and Data Privacy Corporate Policy and take information security and data privacy training.

4.4 Accessibility, Accommodations, and Supports

ACT makes every effort to design our assessments to be universally accessible to all test takers, recognizing that some students may need specific accommodations and accessibility supports to demonstrate what they know and can do. PreACT 9 Secure permits the use of supports that will honor the skills and knowledge being tested while removing construct-irrelevant barriers to student performance.

Although ACT designs the standardized testing experience to be the same for all students, ACT does afford language supports for English learners and accommodations for students with documented disabilities to provide equitable access to the test without compromising the validity of the test results.

The four types of accessibility supports available for use with PreACT 9 Secure are as follows:

- universal supports
- designated supports
- accommodations
- English learner supports

4.4.1 Universal Supports

Universal supports are accessibility aids made available to all students to foster greater inclusion in the experience of taking the standardized test. Universal supports are embedded into testing practices and platforms.

Universal supports embedded into PreACT 9 Secure include the following:

- ability to use log-in tickets as scratch paper
- embedded calculator for the math test
- section directions available on demand
- ability to ask for clarification or repetition of verbal instructions

- ability to mark items for review
- highlighter
- ability to adjust color contrast
- magnification device/zoom
- answer eliminator
- answer masking tool

4.4.2 Designated Supports

Designated supports are adjustments to a test that are available to any student with an identified need. Typically, designated supports are adjustments to the testing environment that require advance planning to deliver. It is recommended that a consistent process be used to determine the supports each student needs. Designated supports for PreACT 9 Secure include the following:

- assistive devices/technology
- food, drink, or medication in the test room for examinees with a medical need (does not include cell phones or other smart devices used to monitor medical conditions)
- frequent breaks that do not stop the testing clock
- noise buffers/earplugs
- permission to stand during testing
- personal aide
- service animal
- small group or one-to-one testing

4.4.3 Accommodations

Accommodations are accessibility supports needed by relatively few students. Students who receive accommodations should have a documented disability and a formal educational plan—generally, a current Individualized Education Program (IEP) or 504 Plan—that indicates their individual needs. It is recommended that this plan be developed by an educational team that includes relevant school personnel, parents/guardians, and the student. Accommodations decisions are usually based on a formal evaluation of a student and of what the student needs to access instruction and assessments.

Successful and secure delivery of an accommodated standardized assessment often requires additional local individuals with specialized skills and knowledge. ACT recommends that students who would use accommodations on an assessment use those same accommodations regularly in an educational setting to become proficient with them.

Examples of accommodations include, but are not limited to, the following:

- timing (e.g., extra testing time, stop-the-clock breaks, multiday administration)
- presentation and formats (e.g., braille, text-to-speech, screen reader software, video American Sign Language)
- response and navigation (e.g., accessible calculator for math, braille response, speech-to-text, scribe)
- setting and location (e.g., medical monitoring devices, background music, fidget device, personalized notification of time remaining)

A complete list of available accommodations is in the Accessibility Supports Guide for PreACT 9 Secure.

4.4.4 English Learner Supports

English learner (EL) supports are available for students who are not proficient in English. Designation as a student with limited English proficiency follows the guidelines set by each individual state department of education. Such a designation is evidence of a need for EL supports. Generally, English language proficiency is measured using an English language proficiency assessment.

Only the following EL supports are available for use on PreACT 9 Secure:

- ACT-authorized bilingual dictionary
- translated test directions, provided by ACT
- one and one-half time, single day
- small-group testing

4.4.5 Testing Students With Accommodations and English Learner Supports

Accommodations and EL supports on PreACT 9 Secure are limited to those that do not invalidate the test construct. Not all accommodations or EL supports provided in the classroom fall into this category.

A student's eligibility to take PreACT 9 Secure with accommodations or EL supports is entirely at the discretion of school personnel. ACT recommends that accommodations and EL supports be selected based on the student's current educational plan, medical plan, or EL status.

Chapter 5: Scoring and Reporting

This chapter describes the scoring and reporting services of PreACT 9 Secure. Additional information on reporting and data services may be found in the [PreACT 9 Secure Interpretative Guide for Student and Aggregate Reports](#).

PreACT 9 Secure scores support interpretations related to college and career readiness. The scores can be linked to descriptions of the knowledge and skills important for college and career readiness and are also linked to college readiness performance standards. The ACT College and Career Readiness Standards provide descriptions of the knowledge and skills students at different score levels typically have. The PreACT Readiness Levels indicate whether students are on target to meet the ACT College Readiness Benchmarks. In addition, PreACT 9 Secure scores support “college-ready now” interpretations through their alignment to the ACT score scale (and ACT College Readiness Benchmarks). Together, the empirically derived Standards and Benchmarks support interpretations regarding college and career readiness as well as the identification of the knowledge and skills that are key to student success.

5.1 Reporting and Data Services

5.1.1 Student Report

The student report includes the following information:

- **PreACT 9 Secure test scores**, including scores for the four section tests (English, math, reading, and science), the Composite score, and the STEM score. The Composite score is the rounded unweighted average of the English, math, and reading scale scores, and the STEM score is the rounded unweighted average of the math and science scale scores (with fractions of 0.5 and higher rounded up).
- **Predicted ACT Composite Score Range** is the range within which the student’s ACT Composite score is expected to fall when the student takes the ACT in the spring of 11th grade. Predictions are also provided for the four test section scores and the STEM score. The predicted score ranges were derived using historical data from the PreACT assessments and ACT test, as described in Chapter 6.
- **Predicted PreACT Composite Score Range** shows where a student’s PreACT Composite score is expected to fall if the student takes the PreACT assessment approximately 1 year after taking PreACT 9 Secure. Predictions are also provided for the four test section scores and the STEM score. The predicted score ranges were derived using historical data from the PreACT assessments, as described in Chapter 6.
- **U.S. Ranks (National Norms)**, which are adopted from PreACT 9 Secure national norms, are the approximate percentages of recent testers whose PreACT 9 Secure scores are less than or equal to the student’s scores. For example, a rank of 56 for the

student's Composite score indicates that 56% of other tested students earned that Composite score or below.

- **The Progress Toward the ACT WorkKeys National Career Readiness Certificate (NCRC) Indicator** provides an estimate of the student's most likely level on the ACT NCRC given their Composite score. The NCRC is an assessment-based credential that documents foundational work skills important for job success across industries and occupations.
- **Detailed PreACT 9 Secure Results** describes students' performance on the reporting categories of the four section tests.

5.1.2 Summary Reports

Summary reports provide aggregated data for different groups of students.

- **My Summary Results** summarizes performance on each section of the test. It reports mean scores (including the Composite and STEM scores) and the percentage of students scoring at each readiness level.
- **How did our students respond to local items?** summarizes responses to each locally administered survey question, providing the number and percentage of students with each response.
- **Average Scores by Ethnicity and Gender** reports mean PreACT 9 Secure test scores by gender and race/ethnicity when demographic data are collected.
- **Local Quartile** reports the percentage of students scoring within each national quartile (first quartile: national percentile ranks of 1–24; second quartile: national percentile ranks of 25–49; third quartile: national percentile ranks of 50–74; fourth quartile: national percentile ranks of 75–100). It also provides the range of PreACT 9 Secure test scores for each quartile.

5.1.3 Additional Online Reporting Tools

Data Tools provides summary statistics, frequency distributions, cross-tabulations, and scatterplots to support additional data analysis. The **Download Hub** allows users to download the complete student-level data file for additional analysis or integration with other data systems.

5.2 Progress Toward the NCRC Indicator

The Progress Toward the ACT National Career Readiness Certificate Indicator provides students with information about their level of career readiness based on their PreACT 9 Secure Composite score. More specifically, this indicator predicts the NCRC level that students are likely to obtain in 12th grade. Using a large sample of students who took a PreACT assessment before taking the WorkKeys assessments, ACT established this prediction by linking students' Composite scores from Grades 8–11 with the NCRC level they earned. Table 5.1 shows the

PreACT suite Composite score ranges that correspond to different predicted NCRC levels. The values are subject to change as updates are made to the predictions. More details on how the predictions were derived are provided in Section 6.3.

Table 5.1. PreACT Assessment Composite Score Ranges Corresponding to Predicted NCRC Levels

NCRC level	PreACT assessment grade level and season						
	Grade 8		Grade 9		Grade 10		Grade 11
	Fall	Spring	Fall	Spring	Fall	Spring	Fall
None	1–8	1–9	1–9	1–9	1–9	1–9	1–9
Bronze	9–13	10–13	10–13	10–13	10–14	10–14	10–14
Silver	14–17	14–17	14–18	14–18	15–18	15–19	15–19
Gold	18–21	18–21	19–22	19–22	19–23	20–23	20–24
Platinum	22–35	22–35	23–35	23–35	24–35	24–35	25–35

Note. The maximum possible scale score for Platinum level is 30 for PreACT 8/9, 32 for PreACT 9 Secure, and 35 for PreACT and PreACT Secure. More information on the Progress Toward the ACT WorkKeys National Career Readiness Certificate Indicator can be found [here](#).

5.3 ACT College and Career Readiness Standards

The ACT College and Career Readiness Standards are statements that describe what students who score in various score ranges on the ACT section tests are *likely* to know and be able to do. ACT began developing the Standards in 1997 and continues to refine them as new data become available. The Standards are based on empirical data that include normative data, college admissions criteria, and information obtained through ACT's Course Placement Service. Content specialists wrote the Standards based on their analysis of the skills and knowledge students need in order to respond successfully to test items that were answered correctly by 80% or more of the examinees who scored within each score range.

A full account of the development of the Standards and a description of the Standards for each test section are given in the *ACT Technical Manual* (ACT, 2025).

5.4 ACT College Readiness Benchmarks

The ACT College Readiness Benchmarks are ACT scores that represent the level of achievement required for a student to have a 50% chance of obtaining a B or higher (or about a 75% chance of obtaining a C or higher) in corresponding credit-bearing first-year college courses at a typical 2-year or 4-year postsecondary institution. These college courses or course areas and the current Benchmarks are given in Table 5.2.

Table 5.2. ACT College Readiness Benchmarks

College course or course area	ACT test section	ACT Benchmark
English Composition I	English/writing	18
College algebra	Math	22
American history, other history, psychology, sociology, political science, and economics	Reading	22
Biology	Science	23
Calculus I, biology, chemistry, physics, and engineering	STEM	26
English Composition I, American history, other history, psychology, sociology, political science, and economics	ELA	20

The Benchmarks are empirically derived and based on the actual performance of students in college. Through ACT's postsecondary research services and other research partnerships, ACT assembled an extensive database consisting of course grades and test score data from a large number of first-year students and a wide range of postsecondary institutions. These data provided an overall measure of what it takes to be successful in selected first-year college courses.

The Benchmarks are subject to change over time. Reasons for updating the Benchmarks include changes in college grading standards and changes in college student performance. The Benchmarks for English, math, reading, and science were updated in 2013 with more recent data from 214 institutions and over 230,000 students. The STEM and ELA Benchmarks were established more recently.

Students, parents, and counselors can use the Benchmarks to determine the academic areas in which students are ready for college coursework, as well as areas in which they may need more preparation. Although the Benchmarks are useful predictors of success in first-year college courses, ACT scores above the cutoffs do not guarantee success. Factors other than academic preparedness, such as motivation and good study habits, are also important for success in college (Robbins et al., 2004).

A description of the development of the ACT College Readiness Benchmarks is provided in the *ACT Technical Manual* (ACT, 2025) and various ACT research reports (Allen, 2013; Allen & Sconing, 2005; Mattern et al., 2015; Radunzel et al., 2015; Radunzel et al., 2017).

5.5 PreACT Readiness Levels and Benchmarks

PreACT 9 Secure can be used to monitor students' progress toward college and career readiness. Based on research using scores from the PreACT assessments, PreACT 9 Secure scores are classified into one of three readiness levels:

1. **On Target.** Students scoring in this range are predicted to meet or exceed the ACT College Readiness Benchmark in 11th or 12th grade. The PreACT Readiness Benchmark is the score associated with a 50% chance of meeting the ACT College

Readiness Benchmark in 11th or 12th grade and is the minimum score for the On Target range.

2. **Close to Target.** Students scoring in this range have a 25%–50% chance of meeting the ACT College Readiness Benchmark.
3. **In Need of Intervention.** Students scoring in this range have less than a 25% chance of meeting the ACT College Readiness Benchmark.

PreACT Readiness Levels are specific to grade level (8, 9, 10, or 11), season (fall or spring), and PreACT score (English, math, reading, science, and STEM). For Grade 11, Readiness Levels are available only for fall. Table 5.3 lists the scale score ranges for the PreACT Readiness Levels that were derived in 2024, along with the PreACT Readiness Benchmark and corresponding ACT College Readiness Benchmark. For more details on how the PreACT Readiness Levels were derived, please see Section 6.4.

Table 5.3. Scale Score Ranges for PreACT Readiness Levels

Score	Grade level / season	PreACT Readiness Level			PreACT Readiness Benchmark	ACT Benchmark
		In Need of Intervention	Close to Target	On Target		
English	8, fall	1–7	8–9	10–30	10	18
	8, spring	1–7	8–10	11–35	11	18
	9, fall	1–8	9–11	12–35	12	18
	9, spring	1–9	10–12	13–35	13	18
	10, fall	1–10	11–13	14–35	14	18
	10, spring	1–11	12–14	15–35	15	18
	11, fall	1–12	13–15	16–35	16	18
Math	8, fall	1–13	14–15	16–35	16	22
	8, spring	1–14	15–16	17–35	17	22
	9, fall	1–14	15–16	17–35	17	22
	9, spring	1–15	16–17	18–35	18	22
	10, fall	1–16	17–18	19–35	19	22
	10, spring	1–16	17–18	19–35	19	22
	11, fall	1–17	18–19	20–35	20	22
Reading	8, fall	1–12	13–15	16–35	16	22
	8, spring	1–13	14–16	17–35	17	22
	9, fall	1–14	15–17	18–35	18	22
	9, spring	1–15	16–18	19–35	19	22
	10, fall	1–16	17–19	20–35	20	22
	10, spring	1–17	18–20	21–35	21	22
	11, fall	1–18	19–21	22–35	22	22
Science	8, fall	1–13	14–16	17–35	17	23
	8, spring	1–14	15–17	18–35	18	23
	9, fall	1–15	16–18	19–35	19	23
	9, spring	1–16	17–18	19–35	19	23
	10, fall	1–17	18–19	20–35	20	23
	10, spring	1–18	19–20	21–35	21	23
	11, fall	1–19	20–21	22–35	22	23
STEM	8, fall	1–16	17–18	19–35	19	26
	8, spring	1–17	18–19	20–35	20	26
	9, fall	1–18	19–20	21–35	21	26
	9, spring	1–19	20–21	22–35	22	26
	10, fall	1–20	21–22	23–35	23	26
	10, spring	1–20	21–22	23–35	23	26
	11, fall	1–21	22–23	24–35	24	26

Note. The maximum possible scale score is 30 for PreACT 8/9, 32 for PreACT 9 Secure, and 35 for PreACT and PreACT Secure.

Chapter 6:

Scaling, Equating, and Technical Characteristics

Scale scores are reported for PreACT 9 Secure English, math, reading, and science tests. Scale scores are also reported for the Composite score and the STEM score. The range of all PreACT 9 Secure scale scores is 1 to 32. More background information on the PreACT 9 Secure scale is available in Section 2.6. This chapter discusses the construction of the score scales and equating methods, documentation of predictions and PreACT Readiness Levels, and other characteristics of the PreACT 9 Secure tests. Section 6.1 describes the equating procedure of PreACT 9 Secure. Section 6.2 documents how the predicted PreACT and ACT score ranges are derived. Section 6.3 documents how predicted ACT WorkKeys National Career Readiness Certificate (NCRC) levels are derived. Section 6.4 documents the derivation of the PreACT Readiness Levels. Section 6.5 describes the PreACT 9 Secure score ranges. Section 6.6 presents the summary of the operational test data from students taking PreACT 9 Secure tests in spring 2026. Section 6.7 describes the PreACT 9 Secure norms. Sections 6.8 to 6.10 present the results of psychometric analyses, including differential item functioning, reliability, measurement error, and classification consistency based on the spring 2026 operational data.

6.1 Equating of PreACT 9 Secure Tests

Post-equating was conducted to create raw-to-scale score conversion tables for each test section of the PreACT 9 Secure tests administered in spring 2026. It was performed through the following procedure. First, based on the responses of Grade 9 students in the equating sample, operational items on the two main forms were calibrated separately with the item response theory (IRT) three-parameter logistic model. Next, the calibrated item parameters were aligned to the ACT item pool scale with the Stocking-Lord linking procedure. Finally, IRT true score equating was conducted to establish conversion tables. These derived conversion tables are used to transform raw scores on the new forms to scale scores.

The Composite and STEM scores, which constitute combinations of individual test section scores, are not directly equated. Instead, they are derived from the rounded arithmetic means of scale scores originating from two or four test sections.

6.2 Predicted PreACT and ACT Score Ranges

One of the primary intended uses of PreACT 9 Secure is to predict how well students will perform on the PreACT as 10th graders and the ACT as 11th graders. Accordingly, PreACT 9 Secure score reports include predicted score ranges for PreACT and ACT scores. The score predictions can help users interpret their PreACT 9 Secure scores, facilitate high school coursework planning, and give students an indication of how much academic growth is needed to meet their goals for college and career readiness. In this section, we document the samples and methods used to derive the predicted score ranges.

6.2.1 Samples Used to Derive the PreACT and ACT Score Predictions

The predictions are updated each year, and here we describe the samples used to derive the predictions that were reported in spring 2026. We used longitudinal data, including PreACT 8/9, PreACT, PreACT Secure, and ACT test scores for students tested through spring 2025.

Two longitudinal samples were used to derive the predictions. Students in Sample 1 took the PreACT or PreACT Secure test in Grade 10. Sample 1 included 52,747 students who took PreACT 8/9 in Grade 8, 198,125 students who took PreACT 8/9 in Grade 9, 64,228 students who took PreACT in Grade 9, and 117,830 students who took PreACT Secure in Grade 9.

Students in Sample 2 took the ACT test in Grade 11. Sample 2 included 69,025 students who took PreACT 8/9 in Grade 8, 209,292 students who took PreACT 8/9 in Grade 9, 101,421 students who took PreACT in Grade 9, and 57,312 students who took PreACT Secure in Grade 9.

We used propensity score weighting (Austin, 2011) to weight each sample to be demographically similar to the target population of students who took the ACT and were projected to complete high school in 2024. The procedure used logistic regression to estimate each student's probability of being in each sample based on gender, race/ethnicity, geographic region, school type (public or private), school locale (rural, town, suburban, or urban), school percentage of students eligible for free or reduced-price lunch, and school mean ACT Composite score (for the 2024 high school graduating cohort). Table 6.1 summarizes the demographics of the longitudinal samples and the target population. The table reports both the unweighted and weighted percentage of students in each demographic category. Relative to the unweighted sample percentages, the weighted sample percentages more closely match the target population percentages.

Table 6.1. Demographics of Samples Used to Derive Predicted PreACT and ACT Scores

Characteristic		Sample 1: PreACT		Sample 2: ACT		Target population %
		%	Wt. %	%	Wt. %	
Gender	Female	46.8	46.2	48.8	46.4	47.2
	Male	48.0	46.1	46.1	45.9	25.5
	Another gender	0.5	0.8	0.4	0.5	0.6
	Missing	4.7	6.9	4.7	7.2	6.7
Race/ethnicity	Asian	3.5	4.1	3.8	4.0	4.1
	Black/African American	8.8	11.5	10.9	12.2	12.0
	Hispanic	14.3	15.7	13.4	15.6	17.9
	Native American	0.9	1.0	0.8	0.9	1.0
	Native Hawaiian/OPI	0.3	0.4	0.2	0.4	0.3
	Two or more races	5.4	5.3	5.5	5.4	5.0
	White	56.6	52.7	59.2	51.0	49.9
	Missing	10.3	9.4	6.3	10.5	9.8
Region	Midwest	55.3	39.8	46.5	34.1	27.3
	Northeast	0.4	0.8	0.6	2.2	3.4
	South	37.8	44.3	47.3	48.8	52.7
	West	6.6	15.0	5.6	15.0	16.6
School type	Private	24.0	12.2	23.8	12.3	9.7
	Public	76.0	87.8	76.2	87.7	90.3
School locale	Rural	15.6	18.9	16.3	18.4	17.5
	Town	15.1	15.4	14.9	15.0	13.2
	Suburban	34.1	32.5	32.6	33.1	33.1
	Urban	28.7	26.8	30.4	26.3	28.0
	Missing	6.5	6.5	5.9	7.2	8.1
High school graduation year	2024	0.0	—	16.3	15.5	0.0
	2025	21.2	20.8	31.5	30.8	100.0
	2026	40.6	40.9	52.3	53.7	0.0
	2027	38.2	38.4	0.0	0.0	0.0

Note. OPI = Other Pacific Islander. The percentages of each characteristic may not add up to 100% due to rounding.

Table 6.2 summarizes the test scores for each weighted sample. The mean and standard deviation of the pretest (Grade 8 and Grade 9 scores) and posttest (Grade 10 PreACT / PreACT Secure score or Grade 11 ACT score) are presented for each test section. In addition, pretest/posttest correlations (r) are presented.

Table 6.2. Test Score Summary Statistics for Samples Used to Derive Predicted PreACT and ACT Scores

Sample	Test section	Pretest		Posttest		<i>r</i>
		Mean	SD	Mean	SD	
Sample 1: PreACT	English	14.79	5.39	16.10	5.96	0.79
	Math	17.05	3.89	17.72	4.39	0.79
	Reading	18.28	6.12	19.21	6.76	0.74
	Science	16.67	4.56	17.36	5.26	0.70
	STEM	17.11	3.89	17.79	4.50	0.82
	Composite	16.83	4.37	17.68	5.16	0.87
Sample 2: ACT	English	15.42	5.57	19.01	6.84	0.78
	Math	17.50	4.16	19.22	5.58	0.79
	Reading	18.97	6.32	20.30	6.88	0.74
	Science	17.31	4.75	19.96	5.64	0.70
	STEM	17.65	4.13	19.84	5.34	0.82
	Composite	17.43	4.60	19.51	5.97	0.87

Note. *r* = Pearson correlation of pretest and posttest scores; *SD* = standard deviation.

6.2.2 Statistical Model Used to Derive the PreACT and ACT Score Predictions

The predictions are derived from a linear regression model where the pretest score is used to predict the posttest score. For each section test score and each combined score (STEM and Composite), the regression model uses linear and quadratic terms of the pretest score to predict the posttest score. For the section test scores and STEM score, the PreACT Composite score is included as an additional predictor variable to improve prediction accuracy. For the section test scores and STEM score, models are also fit without the Composite score so that predictions can still be reported for examinees who do not have a Composite score. Each regression model includes additional variables so that predictions can be derived under different scenarios of number of months between pretest and posttest, the interaction between the number of months between the pretest and posttest and pretest score, whether the onset of the COVID-19 pandemic (March 2020) occurred between the pretest and posttest, the pretest assessment type (PreACT 8/9, PreACT, or PreACT Secure). For Sample 1, the posttest assessment type (PreACT or PreACT Secure) was also used as a predictor.

With the fitted models, a 50% prediction interval forms the lower and upper bound of the predicted score range for each possible combination of pretest score, Composite score, number of months between pretest and posttest, whether the onset of the COVID-19 pandemic (March 2020) occurred between the pretest and posttest, and assessment type. The lower and upper bounds are obtained after rounding the prediction interval endpoints to the nearest integer.

The score predictions that are reported assume that students will take the PreACT Secure test either one or two years after taking PreACT 9 Secure and that they will take the ACT test in the spring of Grade 11. Therefore, the PreACT Secure score predictions are based on the following scenarios for number of months between the PreACT 9 Secure and PreACT Secure tests: 24 months for PreACT 9 Secure administered in Grade 8 and 12 months for PreACT 9 Secure administered in Grade 9. The ACT score predictions are based on the following scenarios for

number of months between the PreACT 9 Secure and ACT tests: 42 months for PreACT 9 Secure administered in fall Grade 8, 36 months for PreACT 9 Secure administered in spring Grade 8, 30 months for PreACT 9 Secure administered in fall Grade 9, and 24 months for PreACT 9 Secure administered in spring Grade 9. The score predictions also assume that the onset of the pandemic did not occur between the pretest and posttest.

After the predicted score ranges were derived, manual adjustments were made to ensure logical consistency across PreACT 9 Secure scores (1–32), grade levels, and predicted outcomes (PreACT Secure and ACT scores). The logical consistency requirements include:

For the section test scores and STEM score:

- For each grade level, season (fall or spring), and Composite score value, PreACT Secure and ACT score range predictions do not decrease as PreACT 9 Secure scores increase.
- For each grade level, season (fall or spring), and PreACT 9 Secure score value, PreACT Secure and ACT score range predictions do not decrease as Composite scores increase.

For the Composite score:

- For each grade level and season (fall or spring), PreACT Secure and ACT score range predictions do not decrease as PreACT 9 Secure scores increase.

For the section test scores, STEM score, and Composite score:

- For Grades 8 and 9, Grade 11 ACT score predictions are not lower than Grade 10 PreACT Secure score predictions.
- PreACT Secure and ACT score range predictions do not decrease with grade level and season. For example, the ACT score predictions for fall Grade 10 should be greater than or equal to the ACT score predictions for spring Grade 9.

6.3 Predictions of ACT WorkKeys National Career Readiness Certificate (NCRC) Level

Another of the primary intended uses of PreACT 9 Secure is to monitor progress toward college and career readiness. To support this use, the Progress Toward Career Readiness Indicator provides students with information about their level of career readiness based on their PreACT 9 Secure Composite score. More specifically, this indicator predicts the NCRC level that students are likely to obtain if they take the ACT WorkKeys assessments in 12th grade. This prediction was established using a longitudinal sample of students who took a PreACT assessment (PreACT 8/9, PreACT, or PreACT Secure) before taking the ACT WorkKeys assessments and attempting to earn an NCRC.

6.3.1 Sample Used to Derive the NCRC Predictions

The sample used to derive the NCRC predictions included 161,303 examinees who took the ACT WorkKeys assessments through March 2024. The sample included 16,319 students who took PreACT 8/9, 144,781 students who took PreACT, and 203 students who took PreACT Secure before taking WorkKeys. The number of months between the PreACT test and the WorkKeys test ranged from 0 to 53, with a mean of 23.7 and a standard deviation of 5.3.

The sample was weighted to represent the target population of all public high school students in the South and Midwest regions of the United States. The target population was derived as students from public high schools that administered the ACT test during the school day to at least 50% of their 11th-grade students in spring 2022. We used propensity score weighting (Austin, 2011) to weight the sample to be like the target population. The procedure used logistic regression to estimate each student's probability of being in the sample based on gender, race/ethnicity, geographic region (South or Midwest only), school locale (rural, town, suburban, or urban), school percentage of students eligible for free or reduced-price lunch, and school mean ACT Composite score (for the 2022 school day–tested cohort). Table 6.3 summarizes the sample's demographics and compares the sample to the target population before and after sample weighting.

Table 6.3. Demographics of Sample Used to Derive Predicted NCRC Levels

Characteristic		Sample		Target population %
		%	Wt. %	
Gender	Female	45.3	48.0	47.5
	Male	46.8	47.3	46.3
	Another gender	1.3	1.1	0.8
	Missing	6.6	3.6	5.4
Race/ethnicity	Asian	2.5	2.4	2.9
	Black/African American	23.0	15.5	15.8
	Hispanic	14.2	16.1	14.9
	Native American	1.1	1.1	1.0
	Native Hawaiian/OPI	0.1	0.2	0.2
	Two or more races	4.9	5.6	5.1
	White	50.3	49.5	50.9
	Missing	3.9	9.8	9.2
Region	Midwest	9.0	29.3	31.0
	Northeast	0.0	0.0	0.0
	South	91.0	70.7	69.0
	West	0.0	0.0	0.0
School type	Public	100.0	100.0	100.0
School locale	Rural	32.2	26.4	24.3
	Town	12.7	18.9	16.4
	Suburban	21.5	24.1	28.5
	Urban	24.8	24.9	25.1
	Missing	8.9	5.7	5.8
High school graduation year	2021	<0.1	<0.1	0.0
	2022	23.6	19.2	0.0
	2023	40.8	37.6	100.0
	2024	29.6	32.6	0.0
	2026	5.9	10.5	0.0
	2026	0.1	0.1	0.0

Note. OPI = Other Pacific Islander. The percentages of each characteristic may not add up to 100% due to rounding.

6.3.2 Statistical Model Used to Derive the NCRC Level Predictions

Among students in the sample, 12.3% earned a Platinum NCRC, 19.2% earned a Gold NCRC, 30.4% earned a Silver NCRC, 25.6% earned a Bronze NCRC, and 12.5% did not qualify for an NCRC. Logistic regression was used with the weighted sample to find the PreACT Suite Composite scores associated with a 50% chance of obtaining each NCRC level or higher. The model included the number of months between pretest and posttest as a covariate, as well as an indicator for whether the onset of the COVID-19 pandemic occurred between the tests. The logistic regression model estimates are provided in Table 6.4.

Table 6.4. Logistic Regression Parameter Estimates Used to Derive Progress Toward Career Readiness Cut Scores

NCRC level	Predictor	Estimate	SE
Bronze	Intercept	-4.172	0.059
	Composite score	0.413	0.003
	Number of months between tests	0.006	0.002
	Pandemic disruption	-0.398	0.021
Silver	Intercept	-6.664	0.047
	Composite score	0.447	0.002
	Number of months between tests	0.007	0.001
	Pandemic disruption	-0.330	0.017
Gold	Intercept	-9.400	0.056
	Composite score	0.456	0.002
	Number of months between tests	0.026	0.001
	Pandemic disruption	-0.288	0.019
Platinum	Intercept	-11.806	0.083
	Composite score	0.456	0.003
	Number of months between tests	0.041	0.002
	Pandemic disruption	-0.288	0.026

Note. SE = standard error

The logistic regression results were then used to find the PreACT Suite Composite scores associated with a 50% chance of scoring at or above each NCRC level, under the assumption that the onset of the COVID-19 pandemic did not occur between the tests. Estimates were obtained for different values of the number of months between the PreACT Suite test and WorkKeys test: 48 (for fall Grade 8), 42 (for spring Grade 8), 36 (for fall Grade 9), 30 (for spring Grade 9), 24 (for fall Grade 10), 18 (for spring Grade 10), and 12 (for fall Grade 11). These values assume that students will take the ACT WorkKeys test in fall of 12th grade. The cut score estimates were obtained by rounding to the nearest integer, resulting in the score ranges presented in Table 6.5 for each NCRC level, grade level, and season.

Table 6.5. PreACT Suite Composite Score Ranges Corresponding to Predicted NCRC Levels

NCRC level	PreACT Suite grade level and season						
	Grade 8		Grade 9		Grade 10		Grade 11
	Fall	Spring	Fall	Spring	Fall	Spring	Fall
Non-Qualifier	1–8	1–9	1–9	1–9	1–9	1–9	1–9
Bronze	9–14	10–13	10–13	10–13	10–14	10–14	10–14
Silver	14–17	14–17	14–18	14–18	15–18	15–19	15–19
Gold	18–21	18–21	19–22	19–22	19–23	20–23	20–24
Platinum	22–35	22–35	23–35	23–35	24–35	24–35	25–35

Note. The maximum possible scale score for Platinum level is 30 for PreACT 8/9, 32 for PreACT 9 Secure, and 35 for PreACT and PreACT Secure.

6.4 Derivation of PreACT Readiness Levels

A study was conducted in 2024 to update the PreACT Readiness Levels. We used longitudinal data, including PreACT 8/9, PreACT, and ACT test scores for students tested through February 2024. Students' PreACT 8/9 and PreACT records were linked to their ACT scores obtained in spring or summer of 11th grade and/or fall, spring, or summer of 12th grade. Five samples were created:

- **Grade 8 PreACT 8/9:** 11,397 students who took PreACT 8/9 in 8th grade during the 2019–2020 academic year and took the ACT in 11th and/or 12th grade
- **Grade 9 PreACT 8/9:** 58,870 students who took PreACT 8/9 in 9th grade during the 2019–2020 or 2020–2021 academic year and took the ACT in 11th and/or 12th grade
- **Grade 9 PreACT:** 119,060 students who took PreACT in 9th grade during the 2016–2017 through 2020–2021 academic years and took the ACT in 11th and/or 12th grade
- **Grade 10 PreACT:** 768,071 students who took PreACT in 10th grade during the 2019–2020 through 2021–2022 academic years and took the ACT in 11th and/or 12th grade
- **Fall Grade 11 PreACT:** 52,399 students who took PreACT in the fall of 11th grade during the 2020–2021 through 2022–2023 academic years and took the ACT in 11th and/or 12th grade

Each sample was weighted to approximately match a target population: the 2023 cohort of ACT-tested high school graduates. To determine the weights, we used logistic regression to estimate propensity score weights (Austin, 2011). The weighting variables included gender, race/ethnicity, school type (public or private), school percentage eligible for free or reduced-price lunch, school locale (rural, town, suburban, or urban), geographic region, and school mean ACT Composite score. Data about school percentage eligible for free or reduced-price lunch were available for most public schools. For schools that did not have these data available, a missing data indicator was used in the logistic regression model used to estimate propensity score weights. School mean ACT Composite score was calculated only for schools with state or district ACT testing programs. For schools that did not participate in these testing programs, a missing data indicator was used in the logistic regression model used to estimate propensity score weights.

After weighting, each sample approximately matched the target population. The five samples were then combined to form the total sample. Some students were included in multiple samples because they took multiple PreACT 8/9 and/or PreACT tests; the total sample included 927,647 students. Table 6.6 provides the distribution of background variables for the total sample before and after weighting. After weighting, the sample percentages were very close to the population percentages.

Table 6.6. Background Characteristics of Total Sample

Characteristic		Sample %		Population (%)
		Raw	Weighted	
Gender	Female	46.5	48.7	48.7
	Male	44.8	46.7	46.4
	Another gender	0.6	0.5	0.7
	Prefer not to respond	1.8	1.3	1.9
	Missing	6.3	2.8	2.3

	Mean	39.2	42.1	42.0
School mean ACT	% Missing	8.0	20.9	23.8
	Mean	18.8	18.7	18.5

Note. OPI = Other Pacific Islander; FRL = free or reduced-price lunch

Students' best ACT test scores in each section were used to determine whether students met the ACT College Readiness Benchmark. (When students tested more than once, their highest math and science scores were used to calculate their STEM score.) Table 6.7 provides test score summary statistics for each test section and grade level included in the total sample.

Table 6.7. Weighted Summary Statistics for PreACT 8/9 or PreACT Scores and Best ACT Scores

Test section	Grade level	N	PreACT 8/9 or PreACT		ACT		
			Mean	SD	Mean	SD	% meeting Benchmark
English	8	11,397	15.6	4.7	19.4	6.4	55.2
	9	177,930	15.9	5.5	19.8	6.8	58.4

	9	177,930	17.9	4.0	20.5	5.3	18.9
	10	768,071	18.7	4.5	20.4	5.5	18.9
	11	52,399	19.1	4.8	20.2	5.3	18.3

Note. *SD* = standard deviation

For each test section, logistic regression was used to model the probability of meeting the ACT College Readiness Benchmark as a function of PreACT 8/9 or PreACT test score (linear and quadratic effects), number of months between PreACT 8/9 or PreACT test and last ACT test, the interactions between PreACT 8/9 or PreACT test score effects and number of months between tests, and an indicator variable for whether the onset of the COVID-19 pandemic occurred between the tests.

The logistic regression models produced estimated probabilities of meeting the ACT Benchmark for each combination of test section, PreACT 8/9 or PreACT score, number of months between tests, and pandemic disruption. To derive the Readiness Level cut scores, we used estimates obtained for specific numbers of months between tests, including the following:

- 45 months between tests for the fall Grade 8 Readiness Levels
- 39 months between tests for the spring Grade 8 Readiness Levels
- 33 months between tests for the fall Grade 9 Readiness Levels

- 27 months between tests for the spring Grade 9 Readiness Levels
- 21 months between tests for the fall Grade 10 Readiness Levels
- 15 months between tests for the spring Grade 10 Readiness Levels
- 9 months between tests for the fall Grade 11 Readiness Levels

Note that the estimates also assume that the onset of the pandemic did not occur between tests; therefore, the Readiness Levels assume that student growth was not disrupted by the onset of the pandemic. Table 6.8 shows the cut score point estimates produced by the logistic regression models, as well as the cut scores that were chosen for the Readiness Levels.

Generally, the cut scores for the On Target Readiness Level were chosen as the scores closest to having a 0.50 probability of meeting the ACT College Readiness Benchmark. Similarly, the cut scores for the Close to Target Readiness Level were chosen as the scores closest to having a 0.25 probability of meeting the ACT College Readiness Benchmark. In some cases, cut scores that deviated slightly from those rules were selected to achieve greater continuity across grade levels. Further, some of the cut scores for the Close to Target Readiness Level were modified to ensure that the cut score was at least 2 score points below the cut score for the On Target Readiness Level. For Grade 8 English, the cut scores for Close to Target were set at 8, despite the estimates being lower. This was done to ensure that the cut scores were not set too low (i.e., approaching scores that students could achieve by guessing).

Table 6.8. Cut Score Point Estimates (and Selected Cut Score) for Readiness Levels

Readiness level	Grade level	Season	Cut score				
			English	Math	Reading	Science	STEM
Close to Target	8	Fall	4.91 (8)	14.91 (14)	11.04 (13)	13.84 (14)	17.70 (17)
	8	Spring	7.21 (8)	15.39 (15)	12.92 (14)	14.95 (15)	18.53 (18)
	9	Fall	8.73 (9)	15.91 (15)	14.49 (15)	15.99 (16)	19.37 (19)
	9	Spring	9.95 (10)	16.47 (16)	15.87 (16)	16.99 (17)	20.21 (20)
	10	Fall	11.01 (11)	17.05 (17)	17.14 (17)	17.95 (18)	21.04 (21)
	10	Spring	11.98 (12)	17.67 (17)	18.35 (18)	18.89 (19)	21.85 (21)
	11	Fall	12.91 (13)	18.30 (18)	19.53 (19)	19.81 (20)	22.63 (22)
On Target (Readiness Benchmarks)	8	Fall	9.56 (10)	16.16 (16)	15.58 (16)	16.67 (17)	19.19 (19)
	8	Spring	10.77 (11)	16.71 (17)	16.94 (17)	17.61 (18)	20.06 (20)
	9	Fall	11.82 (12)	17.31 (17)	18.19 (18)	18.52 (19)	20.93 (21)
	9	Spring	12.77 (13)	17.93 (18)	19.38 (19)	19.41 (19)	21.78 (22)
	10	Fall	13.67 (14)	18.59 (19)	20.52 (20)	20.29 (20)	22.61 (23)
	10	Spring	14.55 (15)	19.26 (19)	21.66 (21)	21.15 (21)	23.41 (23)
	11	Fall	15.43 (16)	19.93 (20)	22.81 (22)	22.01 (22)	24.16 (24)

6.5 PreACT 9 Secure Score Ranges

Measurement precision on the PreACT 9 Secure student score reports is represented by ± 1 *CSEM* (conditional standard error of measurement) from the student's scale score. *CSEM* values were computed for each form following the IRT-based procedure described by Kolen and Brennan (2004, pp. 301–302) with simulated θ values from -8 to 8 . The specific steps and formula for computing the *CSEM* values are as follows.

Step 1. For a given specific θ_i point, the recursive formula by Lord and Wingersky (1984) was used to find the conditional distribution of observed raw scores, which is symbolized as $f(X|\theta_i)$. Based on the raw-to-scale conversion table obtained using the IRT true score equating method, $f(X|\theta_i)$ was transformed to the conditional distribution of possible scale score points for a certain examinee with a specific ability of θ_i .

Step 2. The expected mean of the conditional distribution of scale scores given θ_i is

$$\xi(\theta_i) = \sum_{j=0}^K sc(j)f(X = j|\theta_i),$$

where $sc(j)$ represents the corresponding scale score for a raw score point j based on the raw-to-scale score conversion on a test with K items.

Step 3. Conditional measurement error variance of scale scores given θ_i is

$$var[sc(j)|\theta_i] = \sum_{j=0}^K [sc(j) - \xi(\theta_i)]^2 f(X = j|\theta_i).$$

The square root of the above error variance represents the *CSEM* of scale scores at a given θ_i . For each scale score from 1 to 32, the corresponding raw score and θ were located. The *CSEM* values were calculated through the formula above and were rounded to integers. The scale score *CSEM* values are continuously monitored and will be updated if significant deviations are found in future administrations. *CSEM* values for all PreACT 9 Secure scale scores can be found in Table 6.9.

Table 6.9. PreACT 9 Secure CSEM Values

6.6 PreACT 9 Secure Spring 2026 Operational Test Data

Over 130,000 examinees took the PreACT 9 Secure tests in spring 2026. Tables 6.10 and 6.11 show the distributions of data for students in Grade 9 based on gender. Considering the relatively small sample size and concerns over privacy, data for other grades is not included in the report.

Table 6.10. Demographic Characteristics of PreACT 9 Secure Spring 2026 Operational Data

Demographic		9th grade	
		N	%
Gender	Female	64,998	48.18
	Male	67,173	49.79
	Other gender*	2,729	2.02
Ethnicity	Black/African American	14,151	10.49
	American Indian/Alaskan Native	727	0.54
	White	45,633	33.83
	Hispanic/Latino	2,834	2.10
	Asian	5,563	4.12
	Native Hawaiian/Other Pacific Islander	103	0.08
	Two or more races	14,262	10.57
	Prefer not to respond	20,680	15.33
	Missing	30,947	22.94

* Other gender category includes “Another gender,” “Prefer not to respond,” and missing.

6.6.1 Scale Score Statistics for the PreACT 9 Secure Spring 2026 Sample

Table 6.11 shows the scale score summary statistics for students in Grade 9 in the PreACT 9 Secure spring 2026 sample. Figure 6.1 shows how the scale scores are distributed by form.

Table 6.11. Scale Score Summary Statistics

Test section	Mean	SD	Skewness	Kurtosis
English	14.84	5.86	0.66	−0.04
Math	17.57	4.59	1.45	1.53
Reading	17.91	6.18	0.83	−0.15
Science	15.53	5.81	1.09	0.59
STEM	16.80	4.90	1.28	1.00
Composite	16.77	5.05	0.93	0.17

Figure 6.1. Scale Score Distribution

6.6.2 Effective Weights

As with the ACT Composite score, the PreACT 9 Secure Composite score is the rounded average of the scale scores of the English, math, and reading test sections. This score evaluates students' general educational development over the four areas. Therefore, it is necessary to report the contributions of individual test section scores to a combined score, which is represented by effective weight. Wang and Stanley (1970) define effective weight as the statistical contribution of the test to the variance of the Composite. The effective weights are calculated based on the variance-covariance matrix between the scale scores. Since the scale scores from the four test sections were equally weighted to compute the Composite score, effective weights, ew_i , were calculated as

$$ew_i = \frac{\sigma_i^2 + \sum_{j \neq i} \sigma_{ij}}{\sum_i [\sigma_i^2 + \sum_{j \neq i} \sigma_{ij}]},$$

where σ_i^2 is the variance of scale scores on test section i , and σ_{ij} is the covariance between scale scores on test sections i and j .

Table 6.12 contains the variance-covariance matrix of the scale scores of one operational form for effective weights calculation based on spring 2026 operational data. For example, the effective weight for English was computed by adding the four numbers in the first row (34.18, 18.94, and 29.12). This sum was then divided by the sum of all the elements in the variance-covariance matrix. Since both variance and covariance are included in the numerator, a greater variance or covariance with other test sections could lead to a greater effective weight.

Table 6.12. Scale Score Variance-Covariances by PreACT 9 Secure Test Form

Test	Test section	English	Math	Reading
Form A	English	34.18	18.94	29.12
	Math	18.94	21.17	20.17
	Reading	29.12	20.17	38.41
Form B	English	34.47	19.01	28.82
	Math	19.01	20.91	19.45
	Reading	28.82	19.45	37.95

Tables 6.13 and 6.14 contain the effective weight for each test section score contributing to the variances of the Composite and STEM scores separately based on the two operational forms. Regarding these scores, the effective weights remain consistent across forms. The effective weights for typical ACT forms from the most recent ACT technical manual (ACT, 2026) are provided as references. Note that the summation of some proportions in Table 6.13 may not equal one due to rounding.

Table 6.13. Effective Weights of Composite Score for the PreACT 9 Secure, PreACT Secure, and ACT Tests

Test	Test section	Number of items	Proportion of total	Effective weight
PreACT 9 Secure (Form A)	English	33	0.38	0.36
	Math	30	0.34	0.26
	Reading	25	0.28	0.38
PreACT 9 Secure (Form B)	English	33	0.38	0.36
	Math	30	0.34	0.26
	Reading	25	0.28	0.38
PreACT Secure	English	36	0.39	0.34–0.37
	Math	32	0.34	0.27–0.28
	Reading	25	0.27	0.36–0.38
ACT	English	40	0.37	0.35–0.36
	Math	41	0.38	0.28–0.30
	Reading	27	0.25	0.34–0.36

Table 6.14. Effective Weights of STEM Score for the PreACT 9 Secure, PreACT Secure, and ACT Tests

Test	Test section	Number of items	Proportion of total	Effective weight
PreACT 9 Secure (Form A)	Math	30	0.54	0.43
	Science	26	0.46	0.57
PreACT 9 Secure (Form B)	Math	30	0.54	0.44
	Science	26	0.46	0.56
PreACT Secure	Math	32	0.52	0.47–0.49
	Science	30	0.48	0.51–0.53
ACT	Math	41	0.55	0.50–0.54
	Science	34	0.45	0.46–0.50

6.6.3 Correlations

The correlations of scale scores were computed based on the spring 2026 PreACT 9 Secure data and compared with the scale score correlations from the most recent PreACT Secure technical manual and ACT technical manual (ACT, 2026), as shown in Table 6.15.

Table 6.15. Correlations Among the PreACT 9 Secure Scores and ACT Test Scores

Test	Test section	English	Math	Reading	Science	Composite	STEM
PreACT 9 Secure (Form A)	English	1.00	0.70	0.80	0.75	0.93	0.77
	Math	—	1.00	0.71	0.77	0.86	0.92

	STEM	—	—	—	—	—	1.00

6.7 PreACT 9 Secure Norms

One of the intended uses of PreACT 9 Secure test scores is to understand student performance relative to national norms. PreACT 9 Secure score reports provide percentile ranks for English, math, reading, science, STEM, and Composite scores. A PreACT suite norming study is typically conducted each year, and the results are used to assign percentile ranks to scores. The goal of the norming study is to estimate norms (including percentile ranks) that are representative of the population of students across the country who eventually take the ACT test. For PreACT, norms are estimated for fall Grade 9, spring Grade 9, fall Grade 10, spring Grade 10, and fall Grade 11. For PreACT 9 Secure, more than 99% of the students in spring 2026 were Grade 9 students. Therefore, only spring Grade 9 norms were estimated. Sample selection and weighting procedures are used to ensure that each sample is representative of the ACT-tested population with respect to gender, race/ethnicity, and school category (defined by public/nonpublic status and percentage of students eligible for free and reduced-price lunch). Through this design, student performance on PreACT 9 Secure can be understood relative to the performance of the population of students who go on to take the ACT test. Detailed descriptions of the PreACT suite norming studies, including norming samples, weighting

methodology, estimation procedures, and analyses results, are documented in separate reports. The PreACT 9 Secure norming table can be found at the [ACT Knowledge Hub](#).

6.8 Differential Item Functioning

Differential item functioning (DIF) is a statistical difference between the probability of a specific population subgroup (the focal group) getting the item right and the probability of a comparison population subgroup (the base group) getting the item right given that both groups have the same level of expertise with respect to the content being tested. DIF analyses of the PreACT 9 Secure tests were conducted for Grade 9 and each operational form. The procedures currently used for the PreACT 9 Secure DIF analyses include the standardized difference in proportion correct (STD) procedure and the Mantel-Haenszel common odds ratio (MH) procedure (Holland & Thayer, 1988). Detailed descriptions of these statistics and their performance in detecting DIF are documented in the ACT research report *Performance of Three Conditional DIF Statistics in Detecting Differential Item Functioning on Simulated Tests* (Spray, 1989).

Both the STD and MH techniques are designed for use with multiple-choice items, and both require data from a significant number of students to provide reliable results. Testing industry standards require a minimum of 300 students for the focal group and 700 students overall (Zwick, 2012). As a result, DIF analyses of PreACT Secure tests were conducted on each multiple-choice item for the seven group comparisons, as shown in Table 6.16 below. Due to a small focal group sample count, DIF results based on Pacific Islander are not included in the technical manual (see Table 6.18).

Based on pre-established criteria, any items in the two operational forms administered during spring 2026 with STD or MH values exceeding the tolerance level were flagged. The flagging criterion for the STD procedure is to flag items when the absolute value of the STD is greater than 0.10. Table 6.17 shows the MH criteria for flagging DIF in multiple-choice items. In this table, MH-CHISQ denotes the *p*-value of the MH chi-square statistic, and MH-D signifies the delta-scaled MH alpha. Table 6.18 presents the items flagged according to the MH procedure. Only one item was flagged as Category C in math on Form A across four ethnicity groups. Under the STD procedure, one item in English and two items in math (in each form) were flagged, while no items were flagged in reading or science. The content experts reviewed all flagged items and found no evidence of bias toward any specific group.

Table 6.16. Group Comparison for DIF Analyses

Focal group	Reference group
Female	Male
African American/Black	White
Hispanic	White
Asian	White
American Indian or Alaska Native	White
Pacific Islander	White
Two or more races	White

Table 6.17. Criteria for the A, B, and C DIF Categories on MH Procedure

Category	Description	Criterion
A	Negligible DIF	Nonsignificant MH-CHISQ ($P > 0.05$) or $ MH-D < 1.0$
B	Moderate DIF	Significant MH-CHISQ ($P \leq 0.05$) and $1.0 \leq MH-D < 1.5$
C	Large DIF	Significant MH-CHISQ ($P \leq 0.05$) and $ MH-D \geq 1.5$

Table 6.18. Summary of DIF Analysis According to MH Procedure

DIF group	Test section	Form A			Form B

6.9 Reliability and Measurement Error

Reliability quantifies the level of consistency in test scores across repeated test administrations and is usually estimated based on a single test administration. Coefficient alpha is one of the most widely used measures of reliability, and it provides reliability estimates for number correct scores. Table 6.19 shows the coefficient alpha reliability estimates for the raw scores of the two PreACT 9 Secure operational forms administered in spring 2026.

Table 6.19. Coefficient Alpha Reliability Estimates for Raw Scores

Form	English	Math	Reading	Science
A	0.86	0.83	0.87	0.84
B	0.86	0.86	0.84	0.84

Under the framework of item response theory, scale score reliability estimates were calculated using the formula by Kolen et al. (1996). The specific formula for scale score reliability is

$$SEM_t^2 = \int_{\theta} var[sc(j)|\theta]g(\theta)d\theta$$

$$REL_t = 1 - \frac{SEM_t^2}{s_t^2},$$

where SEM_t^2 is the estimated error variance of the measurement for test section t , and s_t^2 is the sample variance of the observed scale score for the section. In addition, $var[sc(j)|\theta]$ is the conditional measurement error variance of scale scores for a given θ , and $g(\theta)$ is the posterior distribution of θ obtained from the empirical data.

The SEM values for each test section (English, math, reading, and science) were then used to calculate the reliabilities of the STEM and Composite scale scores. The estimated standard error of measurement for the Composite score (SEM_c) is calculated as

$$SEM_c = \sqrt{\frac{\sum_{t=1}^4 SEM_t^2}{4}},$$

where the summation is over SEM^2 of the three test sections. The estimated reliability of the Composite score (REL_c) is calculated as

$$REL_c = 1 - \frac{SEM_c^2}{s_c^2},$$

where s_c^2 is the observed scale score variance for the Composite score.

Similarly, the estimated standard error of measurement for the STEM score (SEM_{stem}) is calculated based on the summation over the SEM^2 values from the math and science scale scores:

$$SEM_{stem} = \sqrt{\frac{SEM_{math}^2 + SEM_{science}^2}{2}}$$

The estimated reliability of the STEM score (REL_{stem}) is calculated as

$$REL_{stem} = 1 - \frac{SEM_{stem}^2}{s_{stem}^2},$$

where s_{stem}^2 is the observed scale score variance for the STEM score.

Table 6.20 exhibits the ranges of scale score reliability estimates and the standard error of measurement (*SEM*) for the two operational forms based on spring 2026 operational data. The estimated reliability and *SEM* ranges for the recent ACT forms (ACT, 2026) are provided as well for comparison.

Table 6.20. Estimated Scale Score Reliabilities and Standard Error of Measurement

Test	Form	Statistic	English	Math	Reading	Science	Composite	STEM
PreACT 9 Secure	A	Reliability	0.85	0.84	0.85	0.78	0.95	0.91
		SEM	2.15	1.79	2.19	2.36	1.18	1.48

			2.31	2.06	2.94	2.35		1.54

6.10 Classification Consistency

PreACT 9 Secure examinees are classified into three college readiness levels based on their scale scores and PreACT Readiness Levels.¹ The classification consistency reflects the percentage of examinees who would be consistently classified into the same achievement level on two equivalent administrations of the test. However, since the test (or parallel forms of the test) is not often administered twice to the same sample, it is necessary to estimate classification consistency with a single test administration using psychometric methods. Two classification consistency indices, agreement rate (Livingston & Lewis, 1995) and Kappa index (Cohen, 1960; Swaminathan et al., 1974), are used to quantify the reliability of categorizing examinees into different readiness levels.

Table 6.21 presents a summary of classification consistency indices—the agreement rate (percentage consistently classified) and Kappa index. In the table, “two levels” refers to On Target/Not on Target decisions, and “three levels” refers to classification using all three Readiness Levels (In Need, Close to Target, and On Target). As can be observed from this table, agreement rates were high with two levels and moderate with three levels for all scores.

¹ Refer to Chapter 5, “ACT College and Career Readiness Standards” and “ACT College Readiness Benchmarks,” for details on the PreACT Readiness Levels.

Table 6.21. Classification Consistency

Form	Test section	Two levels		Three levels	
		Agreement	Kappa	Agreement	Kappa

Chapter 7: Validity Evidence

According to the *Standards for Educational and Psychological Testing*, “validity refers to the degree to which evidence and theory support the interpretations of test scores for proposed uses of tests” (American Educational Research Association [AERA] et al., 2014, p. 11). Validation is the process of justifying intended interpretations and uses and may involve logical, empirical, or theoretical components.

This chapter describes evidence of the validity of PreACT 9 Secure scores. Validity evidence is provided with respect to five areas: 1) test content, 2) response process, 3) internal structure, 4) relations to other variables, and 5) consequences of testing.

As discussed in Chapter 1, the primary uses of PreACT 9 Secure include

- monitoring progress toward college and career readiness,
- predicting performance on the ACT test and ACT WorkKeys assessments, and
- identifying academic gaps and areas for improvement.

Secondary uses of PreACT 9 Secure include

- gauging readiness for advanced high school courses,
- evaluating school and program effectiveness,
- facilitating college and career exploration and planning, and
- understanding performance relative to national norms.

The collection of evidence presented in this technical manual (and other PreACT 9 Secure test documentation) supports the intended uses of PreACT 9 Secure. Test users may develop particular interpretations and additional uses that are not covered in this technical manual. Each use needs to be justified by a validity argument, and evidence will continue to be gathered and evaluated as the uses of PreACT 9 Secure evolve.

7.1 Evidence Based on Test Content

PreACT 9 Secure helps students prepare for the ACT and lets students and educators monitor progress toward college and career readiness. One of the intended uses of PreACT 9 Secure is to predict student performance on the ACT, which helps facilitate educational and career planning. Based on this intended use, content-related evidence is provided through the evaluation of the connections between PreACT 9 Secure and the ACT with respect to the content domain, the knowledge and skills implied by the PreACT 9 Secure specifications, the characteristics of the items, and the development of test forms.

As described in Chapters 2 and 3, PreACT 9 Secure contains four content domains (English, mathematics, reading, and science). PreACT 9 Secure is designed with developmentally articulated test specifications, ensuring that the content measured follows a logical developmental sequence across the high school experience from Grades 8 and 9 (PreACT 8/9 and PreACT 9 Secure) to Grade 10 (PreACT or PreACT Secure) to Grades 11 and 12 (the ACT test). The programs also share item formats and follow consistent reporting procedures. PreACT 9 Secure is reviewed every year by subject matter experts to ensure that its basic structure matches those of PreACT Secure and the ACT and that the tests' scale scores are comparable.

The ACT College and Career Readiness Standards are statements of what students should know and be able to do in order to be college and career ready (or on the way to becoming so) in English, math, reading, and science at each grade level. The knowledge and skills a student currently has (and areas for improvement) can be identified by examining the student's PreACT 9 Secure scores with respect to the Standards. These standards are consistent with many states' standards focusing on college and career readiness.

ACT periodically conducts academic research and surveys, including the ACT National Curriculum Survey, to ensure the continued appropriateness of the content on its assessments. In light of the curriculum survey results, ACT subject matter experts developed the PreACT 9 Secure test content specifications (the number and types of items to be included in each test section and the depth of knowledge [DOK] level of each item). They also reviewed the specific characteristics of the test items in each specification category to determine the accuracy and appropriateness of the collection of items. Subject matter experts review new test forms to verify their content accuracy and confirm the match between the content of the tests and the content specifications. The items that meet the content specifications are also reviewed for content accuracy, word count, item classification, item format, and language.

Items selected to be administered on PreACT 9 Secure have a wide distribution of item difficulties so that the tests will effectively differentiate among students who vary widely in their levels of achievement. However, since PreACT 9 Secure is designed to be administered before PreACT Secure or the ACT, its statistical specifications are carefully reviewed to ensure that it has an overall mean item difficulty that is somewhat easier than that of a typical PreACT, PreACT Secure, or ACT form.

7.2 Evidence Based on Response Process

According to the *Standards*, some intended interpretations of test scores are based on the assumption that a particular psychological process or cognitive operation is used by test takers. "Theoretical and empirical analyses of the response processes of test takers can provide evidence concerning the fit between the construct and the detailed nature of the performance or response actually engaged in by test takers" (AERA et al., 2014, p. 15). Procedures like think-alouds and cognitive labs are commonly used to provide this type of validity evidence.

As mentioned previously, PreACT 9 Secure, like the ACT, was developed using a theory of action. The theory of action helps answer questions related to the purposes of the assessment—intended users, uses, benefits, interpretations, and assessment outcomes. The answers to these questions provide information needed to identify high-value skill targets in each subject area, providing focal points for the development of tasks and test forms. The process set forth by the theory of action further gives rise to potential ways of bringing about the intended goals of the assessment. For example, cognitive labs, piloting, and field-testing are used to evaluate student response processes on items and iteratively improve the specifications and design of the assessment. The related analyses can provide evidence related to the fit between the constructs and the cognitive processes engaged in by test takers. The collection and evaluation of all validity evidence is ongoing, and additional evidence based on response processes may be provided in the future.

7.3 Evidence Based on Internal Structure

As indicated by the *Standards* (AERA et al., 2014), analyzing internal structure includes evaluating intended score interpretations from the perspective of expected relationships among test items or parts of the test. Therefore, the internal structure of PreACT 9 Secure can be evaluated via an analysis of dimensionality.

Exploratory factor analyses were conducted on data from two PreACT 9 Secure operational forms administered in spring 2026 to explore the dimensionality of the constructs measured by the test. PreACT 9 Secure measures student development in the general areas of English, math, reading, and science. While category scores are also reported to describe performance on skill areas within each subject, we expect to find one dominant dimension in an empirical analysis of dimensionality. In the exploratory factor analyses, scree plots of eigenvalues, model fit, and factor loadings were examined to provide validity evidence of internal structure.

A scree plot shows the relationship between eigenvalues and the number of extracted factors and is typically evaluated by identifying the “elbow” in the plot, which indicates the number of dimensions to retain (Cattell, 1966). Figure 7.1 shows the scree plots of two operational forms for the English, mathematics, reading, and science tests. As shown in this figure, the elbow appears after the first eigenvalue, which is evidence for a single dimension. Tables 7.1–7.4 show the proportion of variance accounted for by the first 10 factors for the English, mathematics, reading, and science tests for the two operational forms. Since the proportions of variance accounted for by the factors after the tenth are trivial, the tables present overall proportions for the remaining factors. As shown in these tables, for each test section, the percentage of variance accounted for by the second factor was smaller than 10%. According to Hatcher (1994), factors that account for less than 10% of the variance should not be retained. As a result of that, it is reasonable to believe that PreACT 9 Secure should be represented by a unidimensional model.

Model fit was evaluated by comparing the model fit index between one- and two-factor models, as shown by the fit statistics given in Table 7.5. The fit statistics include the widely used chi-square test, plus other fit statistics—the comparative fit index (CFI), the Tucker-Lewis index

(TLI), the root mean square error of approximation (RMSEA), and the standardized root mean square residual (SRMR)—to supplement the chi-square index due to its sensitivity to large sample sizes (Bollen, 1989; Hu & Bentler, 2009). Table 7.5 also shows the differences in the fit statistics (DIFF) between the one- and two-factor models. The interfactor correlation (CORR) between Factors 1 and 2 in Table 7.5 was used to evaluate how well the two factors could be distinguished from each other in the model. All these statistical indices were simultaneously evaluated to compare the goodness of fit of the one- and two-factor models. Fit statistics for the English, mathematics, reading, and science tests showed evidence supporting the one-factor model in most cases. Although the chi-square tests were statistically significant for all tests, this was likely due to the sensitivity of chi-square statistics to large sample sizes. Compared with the use of the one-factor model, the use of the two-factor model did not substantially improve the model fit. The interfactor correlations in the two-factor model were relatively large (>0.5) for all tests, which indicates a strong relationship between the two factors. Based on the principle of parsimony, the one-factor model was considered adequate for PreACT 9 Secure.

Note. * $p < .001$. DF is the degree of freedom; CFI is the comparative fit index; TLI is the Tucker-Lewis index; RMSEA is the root mean square error of approximation; SRMR is the standardized root mean square residual; and CORR is the correlation between Factor 1 and Factor 2 loadings. Flag criteria included $CFI < 0.95$, $TLI < 0.95$, $RMSEA > 0.06$, $SRMR > 0.08$, $|DIFF\ CFI| > 0.1$, $|DIFF\ TLI| > 0.1$, $|DIFF\ RMSEA| > 0.05$, and $|DIFF\ SRMR| > 0.05$. $|DIFF|$ represents the absolute difference for an index (Hu & Bentler, 2009).

7.4 Evidence Based on Relationships to Other Variables

Intended uses of PreACT 9 Secure include monitoring progress toward college and career readiness and predicting performance on the ACT. PreACT 9 Secure measures academic achievement related to major curriculum areas. These intended interpretations and uses of PreACT 9 Secure test scores imply that they should be both predictive of ACT test scores and related to academic performance in high school. Studies were conducted to evaluate the relationships between scores from PreACT assessments and multiple outcomes, including ACT test scores, high school coursework and grades, success in advanced high school courses, and success on Advanced Placement (AP) exams. The results are summarized below. Because PreACT 9 Secure was first administered in spring 2025, additional evidence will be evaluated for PreACT 9 Secure in the coming years.

7.4.1 Relationship With ACT Test Scores

Using PreACT Secure scores from the 2023–2024 and 2024–2025 academic years and 11th-grade ACT scores from the 2025–2026 academic year, ACT examined correlations of PreACT Secure and ACT scores. This analysis was based on two groups of students:

- 9th-grade PreACT Secure sample: 60,047 students who took PreACT Secure in 9th grade and took the ACT in 11th grade
- 10th-grade PreACT Secure sample: 242,851 students who took PreACT Secure in 10th grade and took the ACT in 11th grade

Table 7.6 presents summary statistics and correlations for PreACT Secure and ACT scores. In addition to Pearson correlations (r), disattenuated correlations (r_{dis}) are presented. Disattenuated correlations are estimates of what the correlations would be if the PreACT Secure and ACT tests measured achievement without error (i.e., had reliabilities of 1.0).

The correlations ranged from .71 (Grade 9 science) to .90 (Grade 10 Composite). Most of the disattenuated correlations are greater than .90, suggesting that the PreACT Secure and ACT tests measure similar constructs. Because the correlation coefficients are very large, the findings indicate that PreACT Secure scores are very strong predictors of ACT scores, supporting the use of scores from the PreACT assessments as predictors of ACT scores.

Table 7.6. Correlations of PreACT and 11th-Grade ACT Scores

PreACT grade	Test section	PreACT		ACT		<i>r</i>	<i>r_{dis}</i>
		Mean	SD	Mean	SD		
9	English	14.6	5.5	18.8	6.3	0.80	0.89
	Math	17.3	3.9	19.6	5.6	0.81	0.91

	Composite	17.1	5.3	19.0	5.7	0.90	0.94

7.4.2 Relationship With High School Coursework and Grades

Because PreACT 9 Secure measures skills that are taught in school and that are related to major curriculum areas, performance on PreACT 9 Secure should indicate readiness for advanced high school coursework. To test these propositions, we examined data from students who took PreACT Secure in 9th grade and who reported their high school grades and coursework when they took the ACT in 11th grade during the 2025–2026 academic year.

Table 7.7 presents correlations between PreACT Secure test scores and high school grade averages. Overall high school grade point average (GPA) was calculated based on students' self-reported grades in core subject areas (English, math, social studies, and natural science). Subject-area GPAs were calculated using the courses within each of the four core subject areas. Correlations between GPAs and test scores from the same subject area were examined (PreACT Secure reading scores were used for social studies courses).

The correlations are presented for the total group ("all students") and for student groups defined by gender, race/ethnicity, and English language learner status. The results of Table 7.7 are summarized as follows:

- PreACT Secure Composite score and overall high school GPA as of Grade 11 are highly correlated ($r = .56$).
- PreACT Secure Composite score and overall high school GPA correlations are similar across gender, racial/ethnic, and English language learner groups.
- Correlations between PreACT Secure scores and high school grade averages are highest in math.

Table 7.7. Correlations of PreACT Secure Scores With High School Grade Averages (GPA and Subject-Specific GPAs), by Student Group

Student group		Number	High school subject area / PreACT Secure test score				
			Overall/ Composite	English/ English	Math/ math	Social studies / reading	Natural science / science
All students		29,633	.56	.44	.50	.41	.46
Gender	Female	15,304	.54	.43	.49	.40	.45
	Male	14,023	.57	.46	.53	.41	.49

	Black/Af. American	1,314	.50	.42	.38	.39	.37
	Hispanic	3,107	.52	.41	.45	.39	.40
	Native American	195	.61	.49	.49	.49	.37
	Native Hawaiian	29	.54	.52	.60	.32	.50
	Two or more races	1,475	.53	.43	.49	.39	.44
	White	22,094	.55	.43	.50	.40	.46
English language learner		1,117	.48	.36	.42	.32	.37

When students register for the ACT or access their MyACT account, they are asked whether they are enrolled in Advanced Placement, accelerated, or honors courses in each core subject area. Students who perform well in advanced high school courses tend to perform better on the ACT and in college. We examined the relationship between PreACT Secure test scores and success in advanced high school courses. For this analysis, the criterion variable was conjunctive: Students who earned a B or higher subject-area GPA (3.00 or higher) and enrolled in at least one advanced course in the same subject area achieved “successful advanced course-taking.”

The probabilities of successful advanced course-taking are graphed in Figure 7.2. The probabilities were estimated using logistic regression and are provided for each core subject area (English, math, social studies, and natural science). Successful advanced course-taking and test scores from the same subject area were examined (PreACT Secure reading scores were used for social studies courses). The probabilities were estimated using data collected for a sample of approximately 29,000 students who took PreACT Secure in 9th grade and the ACT in 11th grade.

From Figure 7.2, we see that the probability of successful advanced course-taking increases sharply as PreACT Secure scores increase. The relationship is strongest in math, followed by natural science, English, and social studies. The PreACT Secure test scores associated with a 50% chance of successful advanced course-taking are 19 (English), 21 (math), 23 (reading), and 22 (science). This evidence supports the use of scores from the PreACT suite of assessments to gauge readiness for advanced high school courses.

Figure 7.2. Relationship of Grade 9 PreACT Secure Scores and Successful Advanced Course-Taking

Note. Values are plotted for PreACT Secure scores between the 1st and 99th percentiles in the sample.

7.4.3 Relationship With AP Exam Success

Radunzel and Allen (2020) found that PreACT scores are good predictors of success on AP exams and estimated the PreACT cut scores associated with AP exam success. Data for the study were available for 49,220 students from 318 high schools who had taken at least one AP exam between May of 2015 and May of 2019 and who had previously taken ACT® Aspire®, PreACT, or the ACT. A concordance of PreACT/ACT scores with ACT Aspire scores was used to combine data across assessments. Full details of the study are documented in an ACT research report (Radunzel & Allen, 2020).

The study defined success in AP courses in two ways—receiving an exam score of 3 or higher and receiving an exam score of 4 or higher—and found that PreACT, ACT, and ACT Aspire scores are positively related to AP exam scores and are good predictors of success in future AP courses. The prediction was strengthened by using combined PreACT scores that were aligned to the content of the AP courses. The sum of the English and reading scores (denoted E+R)

was used for ELA-related AP courses, and the STEM score (the average of the mathematics and science scores) was used for STEM-related courses. As a result, the recommended links to AP exam success were developed in relation to content-relevant scores for most courses (shown in Table 7.8).

For each course and outcome, two cut scores are provided—one for fall and one for spring testing—to account for when students take a PreACT assessment. For example, the first row of results within the table indicates that students who test in the fall and achieve a PreACT E+R score of 42 or higher are likely academically ready to take AP English Language and Composition in the subsequent academic year, as they have a 50% or greater chance of earning a 3 or higher on the corresponding AP exam. Those with an E+R score of 54 or higher have a 50% or greater chance of earning a score of 4 or higher. The AP-ready cut scores derived from spring testing are slightly higher at 45 (for 3 or higher) and 56 (for 4 or higher) to account for the reduced time between PreACT testing and taking the AP exam. Table 7.8 also reports the correlations (r) between test scores (PreACT, ACT, or ACT Aspire) and AP exam scores.

For a holistic view of student readiness for AP courses, we recommend using PreACT 9 Secure scores in combination with other readiness measures (e.g., high school coursework taken, high school grades, motivation, and interest).

Table 7.8. PreACT Scores Associated with Approximately a 50% Chance of Success on AP Exams

Note. E+R = English + reading score. Comp. = Composite score

*Cut scores are not reported for AP Calculus BC. As recommended by College Board as part of AP Potential, students who meet the AP Calculus AB cut scores and perform well in courses leading up to calculus may consider taking AP Calculus BC.

**Cut scores are not reported for AP Physics 2. As recommended by College Board as part of AP Potential, students who meet the AP Physics 1 cut scores and perform well in prerequisite courses for AP Physics 2 may consider taking AP Physics 2.

7.5 Evidence Related to Consequences of Testing

Consequences of testing include (a) interpretations and uses of test scores intended by the test developer, (b) claims made about the test that are not directly based on test scores, and (c) unintended consequences (AERA et al., 2014). In this section, we discuss intended consequences of PreACT 9 Secure testing and discuss research that examined the effects of PreACT adoption on college readiness outcomes.

7.5.1 *Intended Consequences of PreACT 9 Secure Testing*

As described in Chapter 1, the intended benefits of PreACT 9 Secure are closely related to its intended uses and include the following:

1. Students gain exposure to the types of content featured on the ACT and to the ACT testing experience.
2. Predicted ACT scores improve understanding of student performance relative to college and career readiness.
3. Students, parents, and educators understand relative strengths and weaknesses in four subject areas that are also assessed by the ACT.
4. Schools and districts gain important insights about curriculum and program effectiveness.
5. Educators can identify students who are ready for advanced high school coursework and college courses.
6. Students engage in effective college and career exploration and planning.
7. Students can better prepare for the ACT (and, more generally, for college and careers).

7.5.2 *Effects of PreACT Adoption on College Readiness Outcomes*

A study conducted in 2018 used quasi-experimental methods to examine the effects of schoolwide PreACT adoption on ACT test scores, participation in challenging high school courses, interest–major fit, and college score-sending behavior (Allen, 2018). The study found that schoolwide adoption of PreACT led to an increase in ACT Composite score of 0.23 score points, which is comparable to one month of instruction. This effect could be due to exposure to test content and items that mimic those on the ACT (Benefit 1), feedback students receive from taking PreACT (Benefit 3), changes in instruction or school programming (Benefit 4), or improvements in ACT test preparation (Benefit 7).

The study also provided evidence of small effects of PreACT adoption on interest–major fit and out-of-state college score-sending (Benefit 6). Schools that adopted PreACT had students with greater fit between their planned college major and their vocational interests, as well as more students sending their ACT scores to out-of-state colleges.

Further, within schools that adopted PreACT, students who participated in the PreACT Educational Opportunity Service (now called ACT Recruit Me) were more likely to send their ACT scores to at least four colleges and at least one out-of-state college. Students who completed the PreACT Interest Inventory had slightly higher fit between their interests and planned major when they took the ACT. The study did not provide evidence of PreACT effects on outcomes related to taking challenging high school courses. Students from schools that

adopted PreACT were no more likely to take accelerated/AP/honors courses or upper-level elective courses in math or science.

As the PreACT 9 Secure assessment program matures, additional research will be needed to examine the consequences of testing.

Chapter 8:

Growth Interpretations

When administered with other ACT assessments, PreACT 9 Secure can be used to generate measures of student growth. Scenarios where growth measures using PreACT 9 Secure scores are of interest include the following:

- Measuring growth from PreACT 9 Secure test to PreACT Secure test when PreACT 9 Secure is administered in Grade 9 and PreACT Secure is administered in Grade 10
- Measuring growth from state assessments to PreACT 9 Secure when state assessments are administered in Grade 8 and PreACT 9 Secure is administered in Grade 9

In this chapter, we describe two types of growth models: the gain score model and the student growth percentile (SGP) model. Both models can describe growth across ACT's college and career readiness assessments.

8.1 Gain Scores

Scores from the PreACT suite of assessments and the ACT test share common scales, making it easier to monitor progress over time. A gain score is the arithmetical difference between scores from one test and scores from the next. Gain scores are an attractive growth measure because of their simplicity and intuitive appeal. Gain scores address the question “How much has a student learned on an absolute scale?” (Castellano & Ho, 2013, p. 35).

Gain scores generally have a high degree of measurement error. The standard error of measurement (SEM) of a gain score is equal to $\sqrt{SEM_x^2 + SEM_y^2}$, where SEM_x and SEM_y are the SEM s of the component test scores. For example, if the SEM of a PreACT 9 Secure English score is 2.2 and the SEM of a PreACT Secure English score is 2.0, then the SEM of the English gain score is 3.0. Because gain scores have relatively large SEM s, it is not uncommon for students to have negative gain scores. Because the SEM s of gain scores are large relative to the average gain, gain scores should not be used to make strong inferences about individual students' learning.

8.1.1 Gain Score Statistics

For all test sections, positive mean gain scores are anticipated because students are expected to increase their knowledge and skills in the tested areas with more schooling. In this section, we examine gain score summary statistics. Table 8.1 uses data collected through spring 2026 to provide summary statistics for 117,936 students who took PreACT 9 Secure in Grade 9 and PreACT Secure in Grade 10, with the tests taken approximately 1 year apart.

Table 8.1. PreACT 9 Secure to PreACT Secure Gain Score Summary Statistics

Test section	Mean scores		<i>r</i>	Mean gain	SD gain	Mean gain per month
	Test 1	Test 2				
Composite	16.72	17.38	0.92	0.65	2.22	0.05
English	15.75	15.24	0.82	-0.52	3.81	-0.04
Math	17.52	18.47	0.85	0.96	2.87	0.08
Reading	17.32	18.39	0.80	1.07	4.12	0.09
Science	15.80	16.90	0.78	1.10	3.80	0.09

Note. *r* = Pearson correlation of Test 1 scores and Test 2 scores; *SD* = standard deviation. The Composite score used for this analysis includes science.

The gain score results from Table 8.1 can be summarized as follows:

- PreACT 9 Secure scores are highly correlated with PreACT Secure scores, with a Composite score correlation of 0.92.
- Positive gain scores averaging about 1 point were observed for math, reading, and science, while a negative mean gain score of -0.52 was observed for English.
- The standard deviation of the gain scores is large relative to the mean, indicating that gain scores for individual students have a high degree of variability.

Table 8.2 presents mean gain scores for student groups defined by gender and race/ethnicity.

Table 8.2. PreACT 9 Secure to PreACT Secure Mean Gain Scores by Student Group

Student group		Number	Test section/score				
			English	Math	Reading	Science	Composite
All students		117,936	-0.52	0.96	1.07	1.10	0.65
Gender	Female	56,500	-0.39	0.85	1.27	1.20	0.74
	Male	59,017	-0.64	1.05	0.87	1.02	0.58
Race/ethnicity	Asian	5,514	0.29	1.47	1.38	0.88	1.00
	Black/African American	11,787	-0.62	0.57	0.72	0.90	0.40
	Hispanic	2,762	-0.83	0.52	0.59	1.05	0.33
	Native American	1,378	-0.74	0.62	0.53	0.93	0.32
	Native Hawaiian/OPI	287	-0.47	0.62	0.46	0.97	0.37
	Two or more races	5,078	-0.51	0.99	1.15	0.90	0.64
	White	48,402	-0.50	1.15	1.33	1.23	0.80

Note. OPI = Other Pacific Islander

The results from Table 8.2 can be summarized as follows:

- Mean gain scores in English, reading, and science are higher for females than for males.
- Mean Composite gain scores are highest for Asian students, followed by White students. Differences across racial/ethnic groups in mean gain scores are smallest for science.

PreACT 9 Secure-to-PreACT Secure gain scores tend to be high for students with very low PreACT 9 Secure scores and low for students with very high PreACT 9 Secure scores (Figure 8.1). For example, students with a PreACT 9 Secure Composite score of 10 had a mean gain of 1.9, while students with a PreACT 9 Secure Composite score of 31 had a mean gain of 0.6. This phenomenon is known as *regression to the mean* and is related to the gain score measurement error issue described earlier. In the middle of the PreACT 9 Secure test score distributions, the average gain scores are more consistent. When determining how much gain should be expected from the PreACT 9 Secure test to the PreACT Secure test, one should consider the mean gain, conditional on PreACT 9 Secure score.

Figure 8.1. PreACT 9 Secure to PreACT Secure Mean Gain Scores by PreACT 9 Secure Score

Note. Values are plotted for PreACT 9 Secure scores between the 1st and 99th percentiles in the sample.

8.2 Student Growth Percentiles

Student growth percentiles (SGPs) represent a student's current achievement compared to that of others with similar prior achievement. SGPs answer the question "What is the percentile rank of a student's score compared to students with similar score histories?" (Castellano & Ho, 2013, p. 89).

The SGPs discussed here are estimated by the SGP R package (Betebenner et al., 2017) using quantile regression methods (Koenker, 2005). When interpreting SGPs, always consider the reference group used to estimate the model. SGPs range from 1 to 99, and an SGP value of 50 represents typical growth relative to students in the reference group with the same prior achievement score.

8.2.1 ACT Growth Modeling Resources

An SGP lookup table is available to download from the ACT [growth modeling resources web page](#). As of fall 2025, the SGP lookup table covered the following assessment scenarios:

- PreACT 8/9 to PreACT 8/9, Grade 8 to Grade 9
- PreACT 8/9 to PreACT, Grade 9 to Grade 10
- PreACT 8/9 to PreACT Secure, Grade 9 to Grade 10
- PreACT 8/9 to ACT, fall Grade 9 to spring Grade 11
- PreACT 8/9 to ACT, spring Grade 9 to spring Grade 11
- PreACT to ACT, fall Grade 9 to spring Grade 11
- PreACT to ACT, spring Grade 9 to spring Grade 11
- PreACT to ACT, fall Grade 10 to spring Grade 11
- PreACT to ACT, spring Grade 10 to spring Grade 11
- PreACT Secure to PreACT Secure, spring Grade 9 to spring Grade 10
- PreACT Secure to ACT, spring Grade 9 to spring Grade 11
- PreACT Secure to ACT, spring Grade 10 to spring Grade 11

Future versions of the SGP table will include PreACT 9 Secure.

The SGPs represent growth norms based on each pair of assessments and the timing of the assessments. The SGPs are based on large samples of students from across the country who tested in recent years through school-day testing programs. The samples are weighted to be

more representative of the population of students who take the ACT through school-day testing programs. The weighting variables include student demographics (race/ethnicity and gender), school poverty level, school type (public or private), school locale (rural, town, suburb, or urban), and school mean ACT score. The weighting procedure ensures that each sample is similar to a common population.

For students tested in the spring of Grade 9 and the spring of Grade 10, Table 8.3 presents SGP estimates for combinations of PreACT 9 Secure and PreACT Secure Composite scores. For example, the SGP for a student who earned a PreACT 9 Secure Composite score of 16 and a PreACT Secure Composite score of 18 is 77. Yellow highlighting with an asterisk indicates score combinations with SGP values that are at least 25 but no greater than 74. These are cases where growth can be considered average. Score combinations to the left of the yellow highlighting indicate below-average growth ($SGP < 25$), and score combinations to the right indicate above-average growth ($SGP > 75$). Table 8.3 includes only scores of 10 and higher; the growth modeling resources provide SGPs for all test sections and all score combinations.

Table 8.3. Spring Grade 9 PreACT 9 Secure to Spring Grade 10 PreACT Secure Composite Score SGPs

	32	1	1	1	1	1	1	1	1	1	1	4	4	4	4	4	4	4	4	4	6	14	20	34*	52*	70*	89	99	99	99	99	99	99	99	99	99	99	99

Note. Yellow highlighting with an asterisk (*) indicates score combinations of average growth ($25 \leq \text{SGP} \leq 74$). The Composite score used for this table includes science.

8.2.2 Aggregating SGPs

Although all test scores have some measurement error, it is compounded for gain scores and SGPs because of the measurement error in both prior and current test scores. For this reason, we do not recommend using SGPs or gain scores as the primary measure of how much an individual student has learned. Instead, we recommend using aggregate forms of gain scores and SGPs for describing growth for groups of students (e.g., by student demographic group, school, or district). The mean SGP and median SGP are common measures of group-level growth. Research suggests that the mean SGP may have advantages over the median SGP in terms of efficiency, greater alignment with expected values, and greater robustness to scale transformations (Castellano & Ho, 2015).

Table 8.4 shows mean SGPs by test section and student group for students who took PreACT 9 Secure in the spring of Grade 9 and PreACT Secure in the spring of Grade 10. The overall mean SGP values ranged from 50.1 in math and reading to 50.9 for English.

Table 8.4. PreACT 9 Secure to PreACT Secure Mean SGPs by Student Group

Student group		Number	Test section/score				
			English	Math	Reading	Science	Composite
All students		117,936	50.9	50.1	50.1	50.4	50.3
Gender	Female	56,500	52.6	49.3	52.3	51.5	51.9
	Male	59,017	49.2	50.8	48.0	49.3	48.7
Race/ ethnicity	Asian	5,514	58.2	58.5	55.7	56.6	54.8
	Black/African American	11,787	47.1	41.7	45.4	44.1	46.2
	Hispanic	2,762	44.5	41.5	43.5	44.8	45.1
	Native American	1,378	45.4	43.0	43.6	44.2	44.3
	Native Hawaiian/OPI	287	47.4	44.6	43.4	44.3	44.8
	Two or more races	5,078	51.6	50.9	51.2	50.1	50.2
	White	48,402	53.0	54.2	53.0	53.3	52.7

Note. OPI = Other Pacific Islander

Table 8.4 shows that mean SGP varies by student subgroup. Males have slightly higher growth in math, whereas females have slightly higher growth in English, reading, and science. SGP differences are also observed across racial/ethnic groups, with Asian students showing the highest growth (Composite mean SGP = 54.8) and Native American students showing the lowest growth (Composite mean SGP = 44.3).
